Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	8064
Number of Logic Elements/Cells	-
Total RAM Bits	73728
Number of I/O	317
Number of Gates	500000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-55°C ~ 125°C (TA)
Package / Case	484-BGA
Supplier Device Package	484-FPBGA (23x23)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/ax500-1fgg484m

Two C-cells, a single R-cell, two Transmit (TX), and two Receive (RX) routing buffers form a Cluster, while two Clusters comprise a SuperCluster (Figure 1-4). Each SuperCluster also contains an independent Buffer (B) module, which supports buffer insertion on high-fanout nets by the place-and-route tool, minimizing system delays while improving logic utilization.

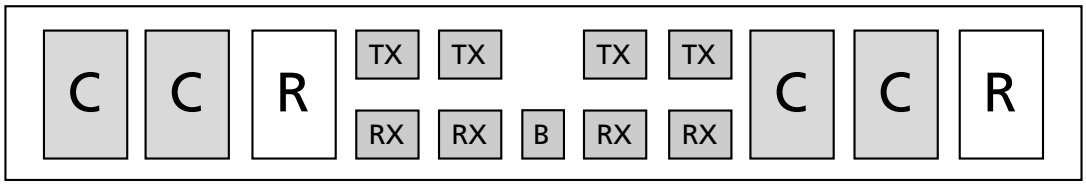

Figure 1-4 • **AX SuperCluster**

The logic modules within the SuperCluster are arranged so that two combinatorial modules are side-by-side, giving a C–C–R – C–C–R pattern to the SuperCluster. This C–C–R pattern enables efficient implementation (minimum delay) of two-bit carry logic for improved arithmetic performance (Figure 1-5 on page 1-3).

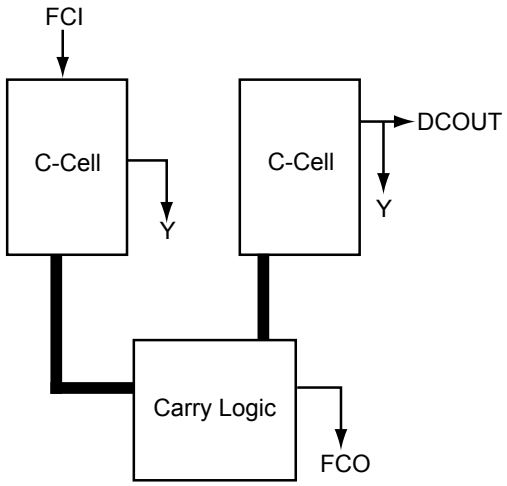

Figure 1-5 • **AX 2-Bit Carry Logic**

The AX architecture is fully fracturable, meaning that if one or more of the logic modules in a SuperCluster are used by a particular signal path, the other logic modules are still available for use by other paths.

At the chip level, SuperClusters are organized into core tiles, which are arrayed to build up the full chip. For example, the AX1000 is composed of a 3x3 array of nine core tiles. Surrounding the array of core tiles are blocks of I/O Clusters and the I/O bank ring (Table 1-1). Each core tile consists of an array of 336 SuperClusters and four SRAM blocks (176 SuperClusters and three SRAM blocks for the AX250).

Table 1-1 • **Number of Core Tiles per Device**

Device	Number of Core Tiles
AX125	1 regular tile
AX250	4 smaller tiles
AX500	4 regular tiles
AX1000	9 regular tiles
AX2000	16 regular tiles

5 V Tolerance

There are two schemes to achieve 5 V tolerance:

1. 3.3 V PCI and 3.3 V PCI-X are the only I/O standards that directly allow 5 V tolerance. To implement this, an internal clamp diode between the input pad and the VCCI pad is enabled so that the voltage at the input pin is clamped, as shown in EQ 3:

Vinput = VCCI + Vdiode = 3.3 V + 0.7 V = 4.0 V

EQ 3

The internal VCCI clamp diode is only enabled while the device is powered on, so the voltage at the input will not be clamped if the VCCI or VCCA are powered off. An external series resistor (~100 Ω) is required between the input pin and the 5 V signal source to limit the current to less than 20 mA (Figure 2-3). The 100 Ω resistor was chosen to meet the input Tr/Tf requirement (Table 2-19 on page 2-21). The GND clamp diode is available for all I/O standards and always enabled.

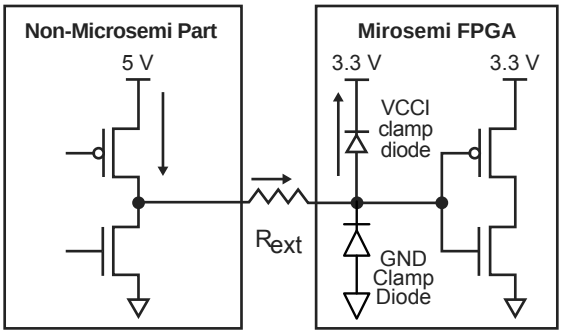

Figure 2-3 • **Use of an External Resistor for 5 V Tolerance**

2. 5 V tolerance can also be achieved with 3.3 V I/O standards (3.3 V PCI, 3.3 V PCI-X, and LVTTL) using a bus-switch product (e.g. IDTQS32X2384). This will convert the 5 V signal to a 3.3 V signal with minimum delay (Figure 2-4).

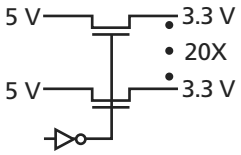

Figure 2-4 • **Bus Switch IDTQS32X2384**

Simultaneous Switching Outputs (SSO)

When multiple output drivers switch simultaneously, they induce a voltage drop in the chip/package power distribution. This simultaneous switching momentarily raises the ground voltage within the device relative to the system ground. This apparent shift in the ground potential to a non-zero value is known as simultaneous switching noise (SSN) or more commonly, ground bounce.

SSN becomes more of an issue in high pin count packages and when using high performance devices such as the Axcelerator family. Based upon testing, Microsemi recommends that users not exceed eight simultaneous switching outputs (SSO) per each VCCI/GND pair. To ease this potential burden on designers, Microsemi has designed all of the Axcelerator BGAs[3] to not exceed this limit with the exception of the CS180, which has an I/O to VCCI/GND pair ratio of nine to one.

Please refer to the *Simultaneous Switching Noise and Signal Integrity* application note for more information.

3. The user should note that in Bank 8 of both AX1000-FG484 and AX500-FG484, there are local violations of this 8:1 ratio.

I/O Standard Electrical Specifications

***Table 2-18* • Input Capacitance**

Symbol	Parameter	Conditions	Min.	Max.	Units
C_{IN}	Input Capacitance	VIN = 0, f = 1.0 MHz		10	pF
C_{INCLK}	Input Capacitance on HCLK and RCLK Pin	VIN = 0, f = 1.0 MHz		10	pF

Table 2-19* • I/O Input Rise Time and Fall Time

Input Buffer	Input Rise/Fall Time (min.)	Input Rise/Fall Time (max.)
LVTTL	No Requirement	50 ns
LVCMOS 2.5V	No Requirement	50 ns
LVCMOS 1.8V	No Requirement	50 ns
LVCMOS 1.5V	No Requirement	50 ns
PCI	No Requirement	50 ns
PCIX	No Requirement	50 ns
GTL+	No Requirement	50 ns
HSTL	No Requirement	50 ns
SSTL2	No Requirement	50 ns
HSTL3	No Requirement	50 ns
LVDS	No Requirement	50 ns
LVPECL	No Requirement	50 ns

*Note: *Input Rise/Fall time applies to all inputs, be it clock or data. Inputs have to ramp up/down linearly, in a monotonic way. Glitches or a plateau may cause double clocking. They must be avoided. For output rise/fall time, refer to the IBIS models for extraction.*

Global Resources

One of the most important aspects of any FPGA architecture is its global resources or clocks. The Axcelerator family provides the user with flexible and easy-to-use global resources, without the limitations normally found in other FPGA architectures.

The AX architecture contains two types of global resources, the HCLK (hardwired clock) and CLK (routed clock). Every Axcelerator device is provided with four HCLKs and four CLKs for a total of eight clocks, regardless of device density.

Hardwired Clocks

The hardwired (HCLK) is a low-skew network that can directly drive the clock inputs of all sequential modules (R-cells, I/O registers, and embedded RAM/FIFOs) in the device with no antifuse in the path. All four HCLKs are available everywhere on the chip.

Timing Characteristics

Global Resource Distribution

At the root of each global resource is a PLL. There are two groups of four PLLs for every device. One group, located at the center of the north edge (in the I/O ring) of the chip, sources the four HCLKs. The second group, located at the center of the south edge (again in the I/O ring), sources the four CLKs (Figure 2-38).

Regardless of the type of global resource, HCLK or CLK, each of the eight resources reach the ClockTileDist (CTD) Cluster located at the center of every core tile with zero skew. From the ClockTileDist Cluster, all four HCLKs and four CLKs are distributed through the core tile (Figure 2-39).

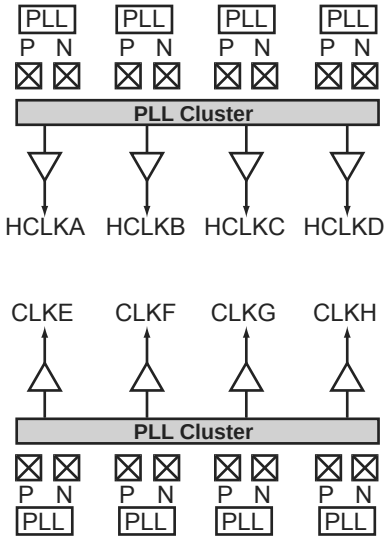

Figure 2-38 • **PLL Group**

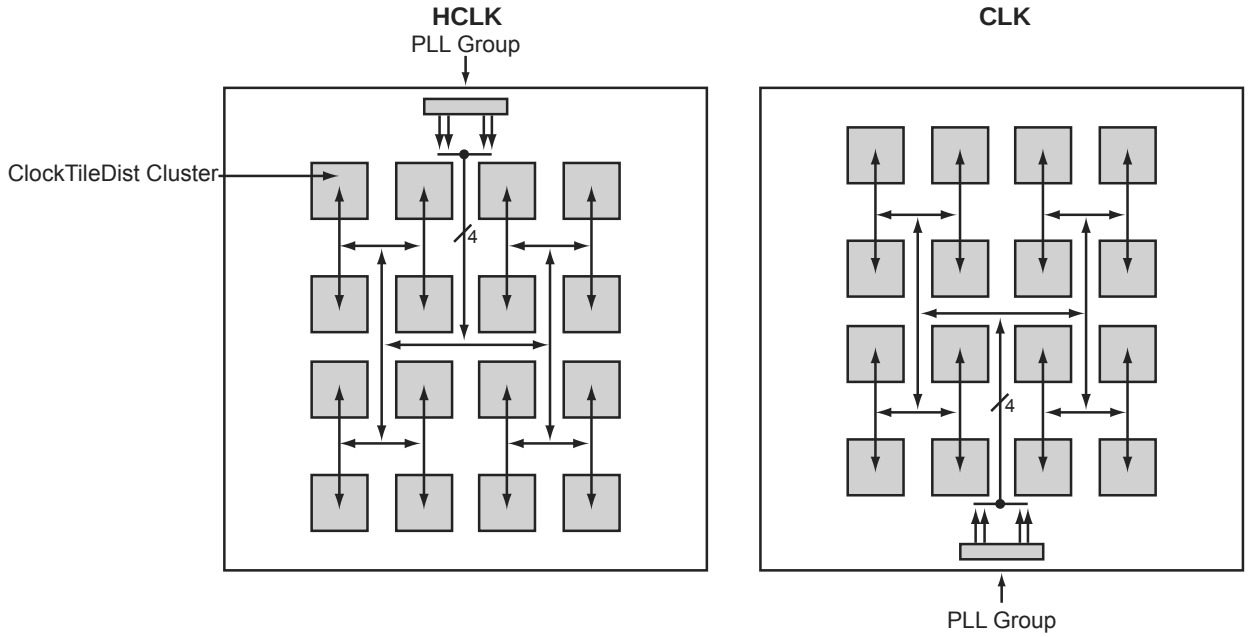

Figure 2-39 • **Example of HCLK and CLK Distributions on the AX2000**

The ClockTileDist Cluster contains an HCLKMux (HM) module for each of the four HCLK trees and a CLKMux (CM) module for each of the CLK trees. The HCLK branches then propagate horizontally through the middle of the core tile to HCLKColDist (HD) modules in every SuperCluster column. The CLK branches propagate vertically through the center of the core tile to CLKRowDist (RD) modules in every SuperCluster row. Together, the HCLK and CLK branches provide for a low-skew global fanout within the core tile (Figure 2-40 and Figure 2-41).

Figure 2-40 • **CTD, CD, and HD Module Layout**

Figure 2-41 • **HCLK and CLK Distribution within a Core Tile**

PLL Configurations

The following rules apply to the different PLL inputs and outputs:

Reference Clock

The RefCLK can be driven by (Figure 2-50):

1. Global routed clocks (CLKE/F/G/H) or user-created clock network
2. CLK1 output of an adjacent PLL
3. [H]CLKxP (single-ended or voltage-referenced)
4. [H]CLKxP/[H]CLKxN pair (differential modes like LVPECL or LVDS)

Feedback Clock

The feedback clock can be driven by (Figure 2-51 on page 2-78):

1. Global routed clocks (CLKE/F/G/H) or user-created clock network
2. External [H]CLKxP/N I/O pad(s) from the adjacent PLL cell
3. An internal signal from the PLL block
