Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Active
Number of LABs/CLBs	8064
Number of Logic Elements/Cells	-
Total RAM Bits	73728
Number of I/O	115
Number of Gates	500000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-55°C ~ 125°C (TA)
Package / Case	208-BFCQFP with Tie Bar
Supplier Device Package	208-CQFP (75x75)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/ax500-cq208m

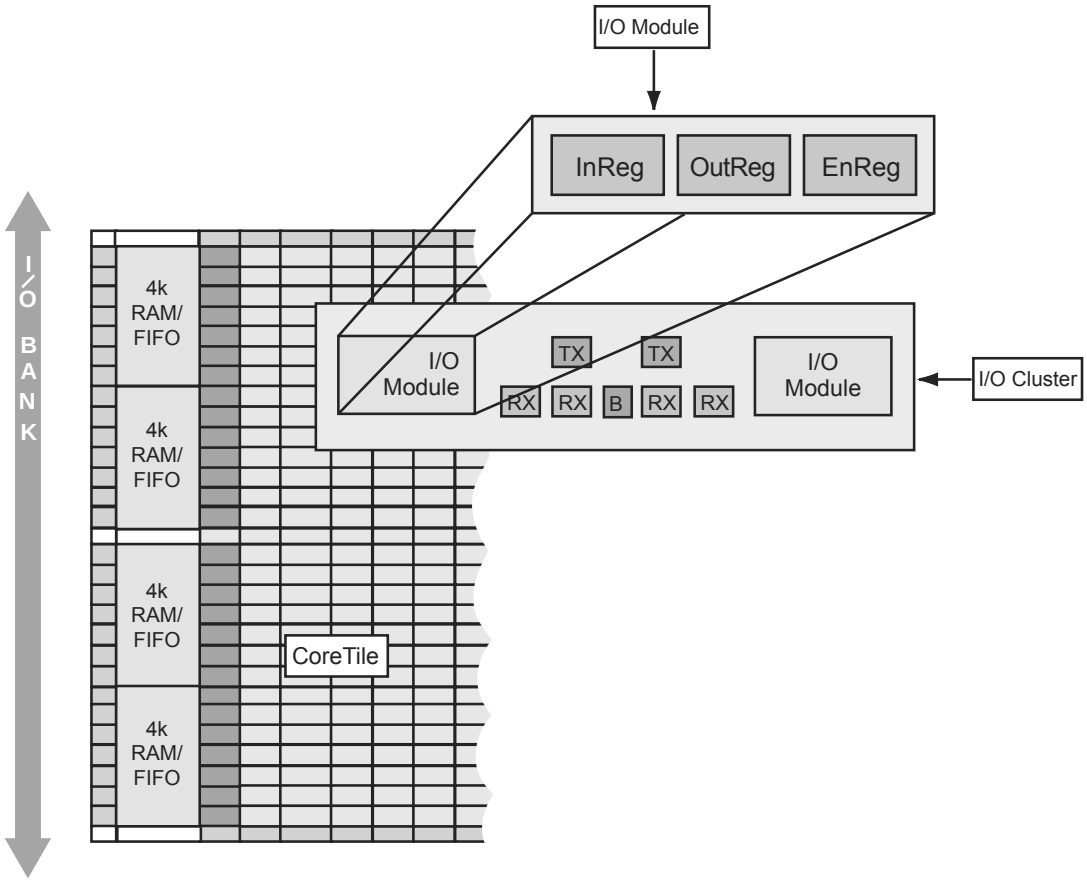

Figure 1-7 • **I/O Cluster Arrangement**

Routing

The AX hierarchical routing structure ties the logic modules, the embedded memory blocks, and the I/O modules together (Figure 1-8 on page 1-6). At the lowest level, in and between SuperClusters, there are three local routing structures: FastConnect, DirectConnect, and CarryConnect routing. DirectConnects provide the highest performance routing inside the SuperClusters by connecting a C-cell to the adjacent R-cell. DirectConnects do not require an antifuse to make the connection and achieve a signal propagation time of less than 0.1 ns.

FastConnects provide high-performance, horizontal routing inside the SuperCluster and vertical routing to the SuperCluster immediately below it. Only one programmable connection is used in a FastConnect path, delivering a maximum routing delay of 0.4 ns.

CarryConnects are used for routing carry logic between adjacent SuperClusters. They connect the FCO output of one two-bit, C-cell carry logic to the FCI input of the two-bit, C-cell carry logic of the SuperCluster below it. CarryConnects do not require an antifuse to make the connection and achieve a signal propagation time of less than 0.1 ns.

The next level contains the core tile routing. Over the SuperClusters within a core tile, both vertical and horizontal tracks run across rows or columns, respectively. At the chip level, vertical and horizontal tracks extend across the full length of the device, both north-to-south and east-to-west. These tracks are composed of highway routing that extend the entire length of the device (segmented at core tile boundaries) as well as segmented routing of varying lengths.

3.3 V LVTTL

Low-Voltage Transistor-Transistor Logic is a general purpose standard (EIA/JESD) for 3.3 V applications. It uses an LVTTL input buffer and push-pull output buffer.

HSTL Class I

High-Speed Transceiver Logic is a general-purpose high-speed 1.5 V bus standard (EIA/JESD8-6). The Axcelerator devices support Class I. This requires a differential amplifier input buffer and a push-pull output buffer.

***Table 2-41* • DC Input and Output Levels**

The HM and CM modules can select between:

- The HCLK or CLK source respectively
- A local signal routed on generic routing resources

This allows each core tile to have eight clocks independent of the other core tiles in the device.

Both HCLK and CLK are segmentable, meaning that individual branches of the global resource can be used independently.

Like the HM and CM modules, the HD and RD modules can select between:

- The HCLK or CLK source from the HM or CM module respectively
- A local signal routed on generic routing resources

The AX architecture is capable of supporting a large number of local clocks—24 segments per HCLK driving north-south and 28 segments per CLK driving east-west per core tile.

Microsemi's Designer software's place-and-route takes advantage of the segmented clock structure found in Axcelerator devices by turning off any unused clock segments. This results in not only better performance but also lower power consumption.

Global Resource Access Macros

Global resources can be driven by one of three sources: external pad(s), an internal net, or the output of a PLL. These connections can be made by using one of three types of macros: CLKBUF, CLKINT, and PLLCLK.

CLKBUF and HCLKBUF

CLKBUF (HCLKBUF) is used to drive a CLK (HCLK) from external pads. These macros can be used either generically or with the specific I/O standard desired (e.g. CLKBUF_LVCMOS25, HCLKBUF_LVDS, etc.) (Figure 2-42).

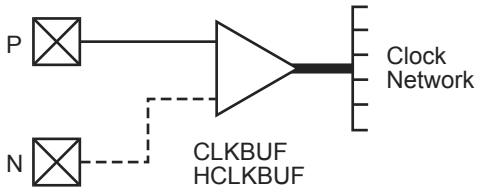

Figure 2-42 • **CLKBUF and HCLKBUF**

Package pins CLKEP and CLKEN are associated with CLKE; package pins HCLKAP and HCLKAN are associated with HCLKA, etc.

Note that when CLKBUF (HCLKBUF) is used with a single-ended I/O standard, it must be tied to the P-pad of the CLK (HCLK) package pin. In this case, the CLK (HCLK) N-pad can be used for user signals.

CLKINT and HCLKINT

CLKINT (HCLKINT) is used to access the CLK (HCLK) resource internally from the user signals (Figure 2-43).

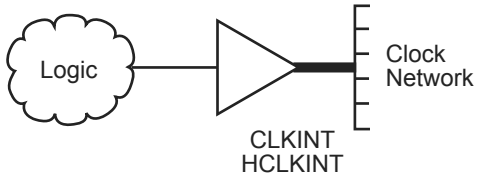

Figure 2-43 • **CLKINT and HCLKINT**

CLK1 and CLK2

Both PLL outputs, CLK1 and CLK2, can be used to drive a global resource, an adjacent PLL RefCLK input, or a net in the FPGA core. Not all drive combinations are possible (Table 2-81).

***Table 2-81* • PLL General Connections Rules**

CLK1	CLK2
HCLK	HCLK
CLK	CLK
HCLK	Routed net output
Routed net output	HCLK
HCLK	NONE
NONE	HCLK
CLK	NONE
NONE	CLK

Note: The PLL outputs remain Low when REFCLK is constant (either Low or High).

Restrictions on CLK1 and CLK2

- When both are driving global resources, they must be driving the same *type* of global resource (i.e. either HCLK or CLK).
- Only one can drive a routed net at any given time.

Table 2-82 and Table 2-83 specify all the possible CLK1 and CLK2 connections for the north and south PLLs. HCLK1 and HCLK2 are used to denote the different HCLK networks when two are being driven at the same time by a single PLL (Note that HCLK1 is the primary clock resource associated with the PLL, and HCLK2 is the clock resource associated with the adjacent PLL). Likewise, CLK1 and CLK2 are used to denote the different CLK networks when two are being driven at the same time by a single PLL (Figure 2-48 on page 2-75).

***Table 2-82* • North PLL Connections**

CLK1	CLK2
HCLK1	Routed net
HCLK1	Unused
HCLK2	HCLK1
HCLK2	Routed net
HCLK2	Both HCLK1 and routed net
HCLK2	Unused
Unused	HCLK1
Unused	Routed net
Unused	Both HCLK1 and routed net
Unused	Unused
Routed net	HCLK1
Routed net	Unused
Both HCLK1 and HCLK2	Routed net
Both HCLK1 and HCLK2	Unused
Both HCLK1 and routed net	Unusable
Both HCLK2 and routed net	HCLK1
Both HCLK2 and routed net	Unused
HCLK1, HCLK2, and routed net	Unusable

Note: Designer software currently does not support all of these connections. Only exclusive connections where one output connects to a single net are supported at this time (e.g.CLK1 driving HCLK1, and HCLK2 is not supported).

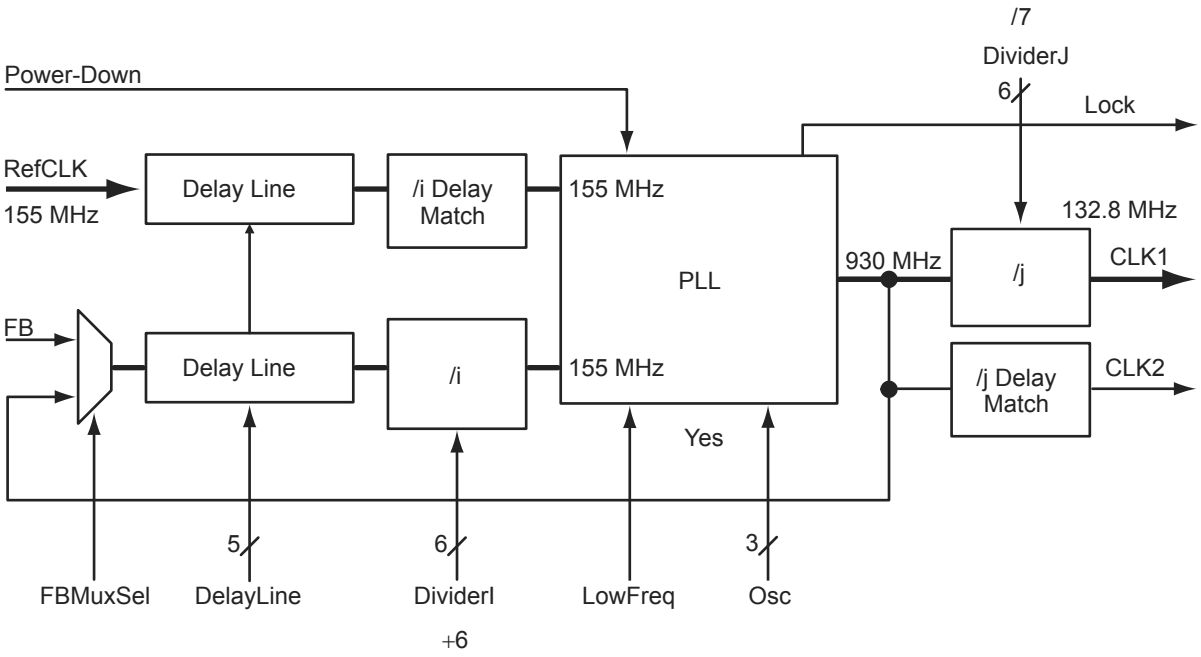

Figure 2-54 • **Using the PLL 155 MHz In, 133 MHz Out**

Note: Timing data for these four cascaded RAM blocks uses a depth of 16,384. For all other combinations, use Microsemi's timing software.

Programming

Device programming is supported through the Silicon Sculptor II, a single-site, robust and compact device programmer for the PC. Up to four Silicon Sculptor IIs can be daisy-chained and controlled from a single PC host. With standalone software for the PC, Silicon Sculptor II is designed to allow concurrent programming of multiple units from the same PC when daisy-chained.

Silicon Sculptor II programs devices independently to achieve the fastest programming times possible. Each fuse is verified by Silicon Sculptor II to ensure correct programming. Furthermore, at the end of programming, there are integrity tests that are run to ensure that programming was completed properly. Not only does it test programmed and nonprogrammed fuses, Silicon Sculptor II also provides a self-test to test its own hardware extensively.

Programming an Axcelerator device using Silicon Sculptor II is similar to programming any other antifuse device. The procedure is as follows:

1. Load the *.AFM file.
2. Select the device to be programmed.
3. Begin programming.

When the design is ready to go to production, Microsemi offers device volume-programming services either through distribution partners or via our In-House Programming Center.

In addition, BP Microsystems offers multi-site programmers that provide qualified support for Axcelerator devices.

For more details on programming the Axcelerator devices, please refer to the *Silicon Sculptor II User's Guide*.
