### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

#### Details

Product Status	Active
Number of LABs/CLBs	8064
Number of Logic Elements/Cells	-
Total RAM Bits	73728
Number of I/O	336
Number of Gates	500000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-55°C ~ 125°C (TA)
Package / Case	676-BGA
Supplier Device Package	676-FBGA (27x27)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/ax500-fgg676m">https://www.e-xfl.com/product-detail/microchip-technology/ax500-fgg676m</a>

## 5 V Tolerance

There are two schemes to achieve 5 V tolerance:

1. 3.3 V PCI and 3.3 V PCI-X are the only I/O standards that directly allow 5 V tolerance. To implement this, an internal clamp diode between the input pad and the VCCI pad is enabled so that the voltage at the input pin is clamped, as shown in EQ 3:

$$V_{\text{input}} = V_{\text{CCI}} + V_{\text{diode}} = 3.3 \text{ V} + 0.7 \text{ V} = 4.0 \text{ V}$$

EQ 3

The internal VCCI clamp diode is only enabled while the device is powered on, so the voltage at the input will not be clamped if the VCCI or VCCA are powered off. An external series resistor ( $\sim 100 \Omega$ ) is required between the input pin and the 5 V signal source to limit the current to less than 20 mA (Figure 2-3). The  $100 \Omega$  resistor was chosen to meet the input  $T_r/T_f$  requirement (Table 2-19 on page 2-21). The GND clamp diode is available for all I/O standards and always enabled.

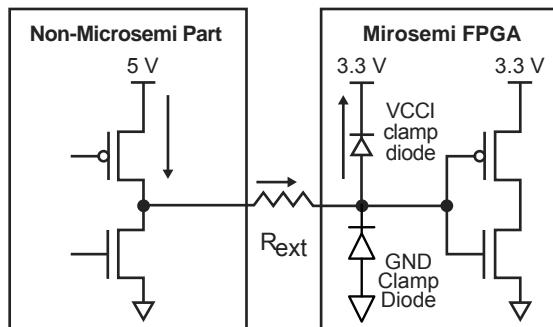

Figure 2-3 • Use of an External Resistor for 5 V Tolerance

2. 5 V tolerance can also be achieved with 3.3 V I/O standards (3.3 V PCI, 3.3 V PCI-X, and LVTTL) using a bus-switch product (e.g. IDTQS32X2384). This will convert the 5 V signal to a 3.3 V signal with minimum delay (Figure 2-4).

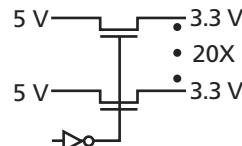

Figure 2-4 • Bus Switch IDTQS32X2384

## Simultaneous Switching Outputs (SSO)

When multiple output drivers switch simultaneously, they induce a voltage drop in the chip/package power distribution. This simultaneous switching momentarily raises the ground voltage within the device relative to the system ground. This apparent shift in the ground potential to a non-zero value is known as simultaneous switching noise (SSN) or more commonly, ground bounce.

SSN becomes more of an issue in high pin count packages and when using high performance devices such as the Axcelerator family. Based upon testing, Microsemi recommends that users not exceed eight simultaneous switching outputs (SSO) per each VCCI/GND pair. To ease this potential burden on designers, Microsemi has designed all of the Axcelerator BGAs<sup>3</sup> to not exceed this limit with the exception of the CS180, which has an I/O to VCCI/GND pair ratio of nine to one.

Please refer to the *Simultaneous Switching Noise and Signal Integrity* application note for more information.

3. The user should note that in Bank 8 of both AX1000-FG484 and AX500-FG484, there are local violations of this 8:1 ratio.

**Table 2-36 • 3.3 V PCI-X I/O Module**

 Worst-Case Commercial Conditions  $VCCA = 1.425\text{ V}$ ,  $VCCI = 3.0\text{ V}$ ,  $T_J = 70^\circ\text{C}$

### **PLLCLK and PLLHCLK**

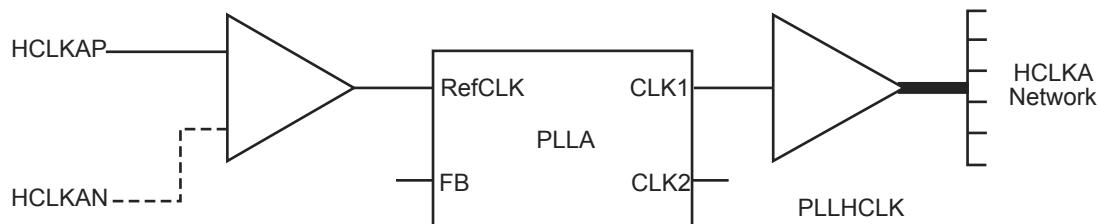

PLLCLK (PLLHCLK) is used to drive global resource CLK (HCLK) from a PLL (Figure 2-44).

**Figure 2-44 • PLLRCLK and PLLHCLK**

### **Using Global Resources with PLLs**

Each global resource has an associated PLL at its root. For example, PLLA can drive HCLKA, PLLE can drive CLKE, etc. (Figure 2-45).

**Figure 2-45 • Example of HCLKA Driven from a PLL with External Clock Source**

In addition, each clock pin of the package can be used to drive either its associated global resource or PLL. For example, package pins CLKEP and CLKEN can drive either the RefCLK input of PLLE or CLKE.

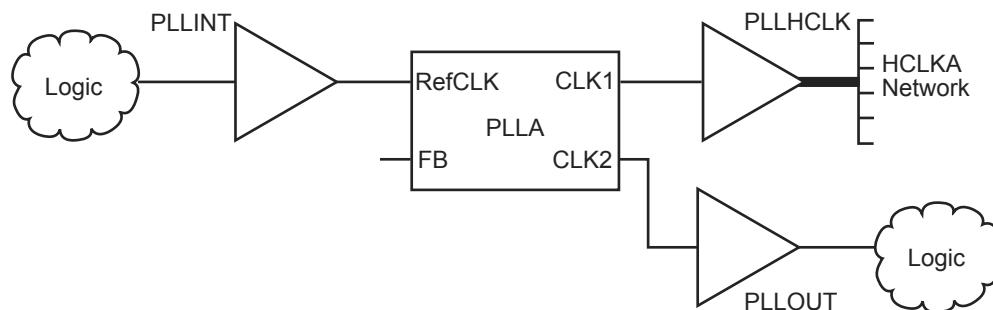

There are two macros required when interfacing the embedded PLLs with the global resources: PLLINT and PLLOUT.

#### **PLLINT**

This macro is used to drive the RefCLK input of the PLL internally from user signals.

#### **PLLOUT**

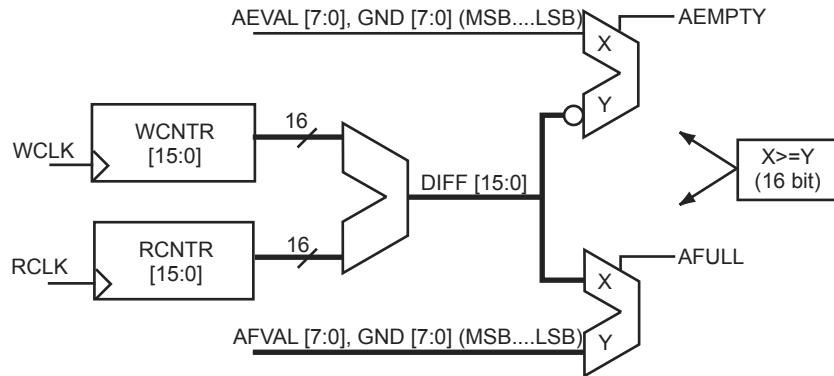

This macro is used to connect either the CLK1 or CLK2 output of a PLL to the regular routing network (Figure 2-46).

**Figure 2-46 • Example of PLLINT and PLLOUT Usage**

Figure 2-63 illustrates flag generation.

---

ALMOST EMPTY and ALMOST FULL Logic

---

**Figure 2-63 • ALMOST-EMPTY and ALMOST-FULL Logic**

The Verilog codes for the flags are:

```
assign AF = (DIFF[15:0] >= {AFVAL[7:0], 8'b00000000})?1:0;
assign AE = ({AEVAL[7:0], 8'b00000000}>=DIFF[15:0])?1:0;
```

The number of DIFF-bits active depends on the configuration depth and width (Table 2-95).

**Table 2-95 • Number of Available Configuration Bits**

Number of Blocks	Block DxW	Number of AEVAL/AFVAL Bits
1	1x1	4
2	1x2	4
2	2x1	5
4	1x4	4
4	2x2	5
4	4x1	6
8	1x8	4
8	2x4	5
8	4x2	6
8	8x1	7
16	1x16	4
16	2x8	5
16	4x4	6
16	8x2	7
16	16x1	8

The active-high CLR pin is used to reset the FIFO to the empty state, which sets FULL and AFULL low, and EMPTY and AEMPTY high.

Assuming that the EMPTY flag is not set, new data is read from the FIFO when REN is valid on the active edge of the clock. Write and read transfers are described with timing requirements in "Timing Characteristics" on page 2-100.

**Table 2-98 • One FIFO Block**

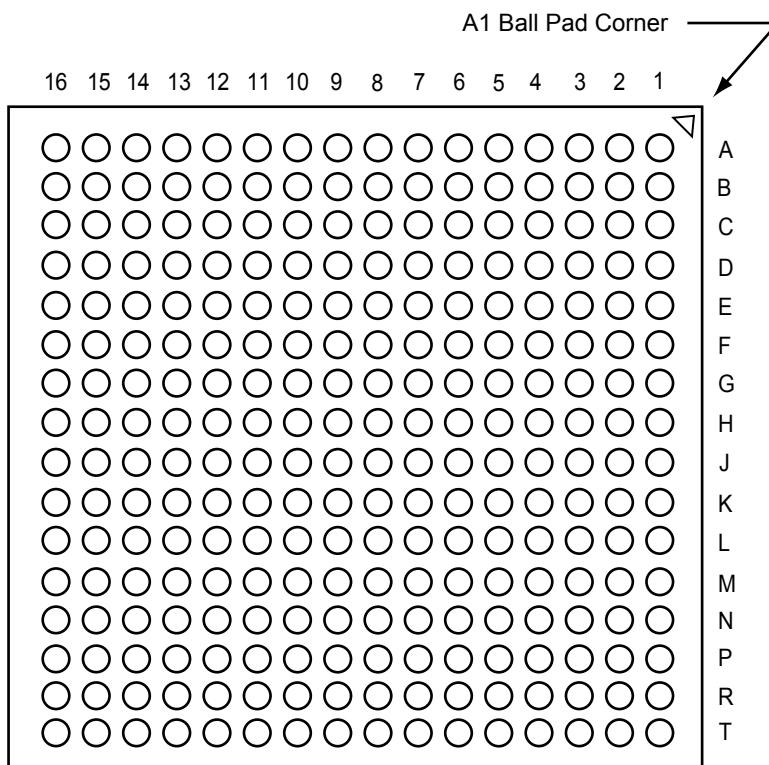

Worst-Case Commercial Conditions VCCA = 1.425 V, VCCI = 3.0 V, TJ = 70°C
