Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Active
Number of LABs/CLBs	8064
Number of Logic Elements/Cells	-
Total RAM Bits	73728
Number of I/O	115
Number of Gates	500000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 85°C (TA)
Package / Case	208-BFQFP
Supplier Device Package	208-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/ax500-pqg208i

Packaging Data

Refer to the following documents located on the Microsemi SoC Products Group website for additional packaging information.

User I/Os²

Introduction

The Axcelerator family features a flexible I/O structure, supporting a range of mixed voltages (1.5 V, 1.8 V, 2.5 V, and 3.3 V) with its bank-selectable I/Os. Table 2-8 on page 2-12 contains the I/O standards supported by the Axcelerator family, and Table 2-10 on page 2-12 compares the features of the different I/O standards.

Each I/O provides programmable slew rates, drive strengths, and weak pull-up and weak pull-down circuits. The slew rate setting is effective for both rising and falling edges.

I/O standards, except 3.3 V PCI and 3.3 V PCI-X, are capable of hot insertion. 3.3 V PCI and 3.3 V PCI-X are 5 V tolerant with the aid of an external resistor.

The input buffer has an optional user-configurable delay element. The element can reduce or eliminate the hold time requirement for input signals registered within the I/O cell. The value for the delay is set on a bank-wide basis. Note that the delay WILL be a function of process variations as well as temperature and voltage changes.

Each I/O includes three registers: an input (InReg), an output (OutReg), and an enable register (EnReg). I/Os are organized into banks, and there are eight banks per device—two per side (Figure 2-6 on page 2-18). Each I/O bank has a common VCCI, the supply voltage for its I/Os.

For voltage-referenced I/Os, each bank also has a common reference-voltage bus, VREF. While VREF must have a common voltage for an entire I/O bank, its location is user-selectable. In other words, any user I/O in the bank can be selected to be a VREF.

The location of the VREF pin should be selected according to the following rules:

- Any pin that is assigned as a VREF can control a maximum of eight user I/O pad locations in each direction (16 total maximum) within the same I/O bank.
- I/O pad locations listed as no connects are counted as part of the 16 maximum. In many cases, this leads to fewer than eight user I/O package pins in each direction being controlled by a VREF pin.
- Dedicated I/O pins such as GND and VCCI are counted as part of the 16.
- The two user I/O pads immediately adjacent on each side of the VREF pin (four in total) may only be used as inputs. The exception is when there is a VCCI/GND pair separating the VREF pin and the user I/O pad location.
- The user does not need to assign VREF pins for OUTBUF and TRIBUF. VREF pins are needed only for input and bidirectional I/Os.

The differential amplifier supply voltage VCCDA should be connected to 3.3 V.

A user can gain access to the various I/O standards in three ways:

- Instantiate specific library macros that represent the desired specific standard.
- Use generic I/O macros and then use Designer's PinEditor to specify the desired I/O standards (please note that this is not applicable to differential standards).
- A combination of the first two methods.

Refer to the *I/O Features in Axcelerator Family Devices* application note and the *Antifuse Macro Library Guide* for more details.

2. Do not use an external resistor to pull the I/O above V_{CCI} for a higher logic "1" voltage level. The desired higher logic "1" voltage level will be degraded due to a small I/O current, which exists when the I/O is pulled up above V_{CCI} .

Using the Weak Pull-Up and Pull-Down Circuits

Each Axcelerator I/O comes with a weak pull-up/down circuit (on the order of 10 kΩ). These are weak transistors with the gates tied on, so the on resistance of the transistor emulates a resistor. The weak pull-up and pull-down is active only when the device is powered up, and they must be biased to be on. When the rails are coming up, they are not biased fully, so they do not behave as resistors until the voltage is at sufficient levels to bias the transistors. The key is they really are transistors; they are not traces of poly silicon, which is another way to do an on-chip resistor (those take much more room). I/O macros are provided for combinations of pull up/down for LVTTL, LVCMOS (2.5 V, 1.8 V, and 1.5 V) standards. These macros can be instantiated if a keeper circuit for any input buffer is required.

Customizing the I/O

- A five-bit programmable input delay element is associated with each I/O. The value of this delay is set on a bank-wide basis (Table 2-14). It is optional for each input buffer within the bank (i.e. the user can enable or disable the delay element for the I/O). When the input buffer drives a register within the I/O, the delay element is activated by default to ensure a zero hold-time. The default setting for this property can be set in Designer. When the input buffer does not drive a register, the delay element is deactivated to provide higher performance. Again, this can be overridden by changing the default setting for this property in Designer.
- The slew-rate value for the LVTTL output buffer can be programmed and can be set to either slow or fast.
- The drive strength value for LVTTL output buffers can be programmed as well. There are four different drive strength values – 8 mA, 12 mA, 16 mA, or 24 mA – that can be specified in Designer.⁵

Table 2-14 • Bank-Wide Delay Values

Bits Setting	Delay (ns)
0	0.54
1	0.65
2	0.71
3	0.83
4	0.9
5	1.01

14	1.81
15	1.93

Bits Setting	Delay (ns)
16	2.01
17	2.13
18	2.19
19	2.3
20	2.38
21	2.49
22	2.55
23	2.67
24	2.75
25	2.87
26	2.93
27	3.04
28	3.12
29	3.23
30	3.29
31	3.41

Note: Delay values are approximate and will vary with process, temperature, and voltage.

5. These values are minimum drive strengths.

3.3 V LVTTL

Low-Voltage Transistor-Transistor Logic is a general purpose standard (EIA/JESD) for 3.3 V applications. It uses an LVTTL input buffer and push-pull output buffer.

1.5 V LVCMOS (JESD8-11)

Low-Voltage Complementary Metal-Oxide Semiconductor for 1.5 V is an extension of the LVCMOS standard (JESD8-5) used for general-purpose 1.5 V applications. It uses a 3.3 V tolerant CMOS input buffer and a push-pull output buffer.

SSTL3

Stub Series Terminated Logic for 3.3 V is a general-purpose 3.3 V memory bus standard (JESD8-8). The Axcelerator devices support both classes of this standard. This requires a differential amplifier input buffer and a push-pull output buffer.

Class I

FIFO Flag Logic

The FIFO is user configurable into various DEPTHS and WIDTHs. Figure 2-62 shows the FIFO address counter details.

- Bits 11 to 5 are active for all modes.
- As the data word size is reduced, more least-significant bits are added to the address.
- As the number of cascaded blocks increases, the number of significant bits in the address increases.

For example, if four blocks are cascaded as a 1kx16 FIFO with each block having a 1kx4 aspect ratio, bits 11 to 2 of the address will be used to specify locations within each RAM block, whereas bits 13 and 12 will be used to specify the RAM block.

Note: Inactive counter bits are set to zero.

Figure 2-62 • FIFO Address Counters

The AFULL and AEMPTY flag threshold values are programmable. The threshold values are AFVAL and AEVAL, respectively. Although the trigger threshold for each flag is defined with eight bits, the effective number of threshold bits in the comparison depends on the configuration. The effective number of threshold bits corresponds to the range of active bits in the FIFO address space (Table 2-94).

Table 2-94 • FIFO Flag Logic

Mode	Inactive AEVAL/AFVAL Bits	Inactive DIFF Bits (set to 0)	DIFF Comparison to AFVAL/AEVAL
Non-cascade	[7:4]	[15:12]	DIFF[11:8] with AE/FVAL[3:0]
Cascade 2 blocks	[7:5]	[15:13]	DIFF[12:8] with AE/FVAL[4:0]
Cascade 4 blocks	[7:6]	[15:14]	DIFF[13:8] with AE/FVAL[5:0]
Cascade 8 blocks	[7]	[15]	DIFF[14:8] with AE/FVAL[6:0]
Cascade 16 blocks	None	None	DIFF[15:8] with AE/FVAL[7:0]

Table 2-100 • Four FIFO Blocks Cascaded
