
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	64MHz
Connectivity	I²C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, HLVD, POR, PWM, WDT
Number of I/O	24
Program Memory Size	16KB (8K x 16)
Program Memory Type	FLASH
EEPROM Size	256 x 8
RAM Size	768 x 8
Voltage - Supply (Vcc/Vdd)	1.8V ~ 3.6V
Data Converters	A/D 19x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Through Hole
Package / Case	28-DIP (0.300", 7.62mm)
Supplier Device Package	28-SPDIP
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic18lf24k22-i-sp

- Two Enhanced Universal Synchronous Asynchronous Receiver Transmitter (EUSART) modules:
  - Supports RS-485, RS-232 and LIN
  - RS-232 operation using internal oscillator
  - Auto-Wake-up on Break
  - Auto-Baud Detect

TABLE 1: PIC18(L)F2X/4XK22 FAMILY TYPES

Device	Program Memory		Data Memory		I/O[1]	10-bit A/D Channels[2]	CCP	ECCP (Full-Bridge)	ECCP (Half-Bridge)	MSSP		EUSART	Comparator	CTMU	BOR/LVD	SR Latch	8-bit Timer	16-bit Timer
	Flash (Bytes)	# Single-Word Instructions	SRAM (Bytes)	EEPROM (Bytes)						SPI	I^2C

1.0 DEVICE OVERVIEW

This document contains device specific information for the following devices:

- PIC18F23K22
- PIC18F24K22
- PIC18F25K22
- PIC18F26K22
- PIC18F43K22
- PIC18F44K22
- PIC18F45K22
- PIC18F46K22
- PIC18LF23K22
- PIC18LF24K22
- PIC18LF25K22
- PIC18LF26K22
- PIC18LF43K22
- PIC18LF44K22
- PIC18LF45K22
- PIC18LF46K22

This family offers the advantages of all PIC18 microcontrollers – namely, high computational performance at an economical price – with the addition of high-endurance, Flash program memory. On top of these features, the PIC18(L)F2X/4XK22 family introduces design enhancements that make these microcontrollers a logical choice for many high-performance, power sensitive applications.

1.1 New Core Features

1.1.1 XLP TECHNOLOGY

All of the devices in the PIC18(L)F2X/4XK22 family incorporate a range of features that can significantly reduce power consumption during operation. Key items include:

- **Alternate Run Modes:** By clocking the controller from the Timer1 source or the internal oscillator block, power consumption during code execution can be reduced by as much as 90%.
- **Multiple Idle Modes:** The controller can also run with its CPU core disabled but the peripherals still active. In these states, power consumption can be reduced even further, to as little as 4% of normal operation requirements.
- **On-the-fly Mode Switching:** The power-managed modes are invoked by user code during operation, allowing the user to incorporate power-saving ideas into their application's software design.
- **Low Consumption in Key Modules:** The power requirements for both Timer1 and the Watchdog Timer are minimized. See **Section 27.0 "Electrical Specifications"** for values.

1.1.2 MULTIPLE OSCILLATOR OPTIONS AND FEATURES

All of the devices in the PIC18(L)F2X/4XK22 family offer ten different oscillator options, allowing users a wide range of choices in developing application hardware. These include:

- Four Crystal modes, using crystals or ceramic resonators
- Two External Clock modes, offering the option of using two pins (oscillator input and a divide-by-4 clock output) or one pin (oscillator input, with the second pin reassigned as general I/O)
- Two External RC Oscillator modes with the same pin options as the External Clock modes
- An internal oscillator block which contains a 16 MHz HFINTOSC oscillator and a 31 kHz LFINTOSC oscillator, which together provide eight user selectable clock frequencies, from 31 kHz to 16 MHz. This option frees the two oscillator pins for use as additional general purpose I/O.
- A Phase Lock Loop (PLL) frequency multiplier, available to both external and internal oscillator modes, which allows clock speeds of up to 64 MHz. Used with the internal oscillator, the PLL gives users a complete selection of clock speeds, from 31 kHz to 64 MHz – all without using an external crystal or clock circuit.

Besides its availability as a clock source, the internal oscillator block provides a stable reference source that gives the family additional features for robust operation:

- **Fail-Safe Clock Monitor:** This option constantly monitors the main clock source against a reference signal provided by the LFINTOSC. If a clock failure occurs, the controller is switched to the internal oscillator block, allowing for continued operation or a safe application shutdown.
- **Two-Speed Start-up:** This option allows the internal oscillator to serve as the clock source from Power-on Reset, or Wake-up from Sleep mode, until the primary clock source is available.

14.2.4 SPECIAL EVENT TRIGGER

When Special Event Trigger mode is selected (CCPxM<3:0> = 1011), and a match of the TMRxH:TMRxL and the CCPRxH:CCPRxL registers occurs, all CCPx and ECCPx modules will immediately:

- Set the CCP interrupt flag bit – CCPxIF
- CCP5 will start an ADC conversion, if the ADC is enabled

On the next TimerX rising clock edge:

- A Reset of TimerX register pair occurs – TMRxH:TMRxL = 0x0000,

This Special Event Trigger mode does not:

- Assert control over the CCPx or ECCPx pins.
- Set the TMRxIF interrupt bit when the TMRxH:TMRxL register pair is reset. (TMRxIF gets set on a TimerX overflow.)

If the value of the CCPRxH:CCPRxL registers are modified when a match occurs, the user should be aware that the automatic reset of TimerX occurs on the next rising edge of the clock. Therefore, modifying the CCPRxH:CCPRxL registers before this reset occurs will allow the TimerX to continue without being reset, inadvertently resulting in the next event being advanced or delayed.

The Special Event Trigger mode allows the CCPRxH:CCPRxL register pair to effectively provide a 16-bit programmable period register for TimerX.

14.2.5 COMPARE DURING SLEEP

The Compare mode is dependent upon the system clock (FOSC) for proper operation. Since FOSC is shut down during Sleep mode, the Compare mode will not function properly during Sleep.

TABLE 14-5: REGISTERS ASSOCIATED WITH COMPARE

Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Register on Page

Legend: — = Unimplemented location, read as ‘0’. Shaded bits are not used by Compare mode.
Note 1: These registers/bits are available on PIC18(L)F4XK22 devices.

14.4.7 START-UP CONSIDERATIONS

When any PWM mode is used, the application hardware must use the proper external pull-up and/or pull-down resistors on the PWM output pins.

The CCPxM<1:0> bits of the CCPxCON register allow the user to choose whether the PWM output signals are active-high or active-low for each pair of PWM output pins (PxA/PxC and PxB/PxD). The PWM output polarities must be selected before the PWM pin output drivers are enabled. Changing the polarity configuration while the PWM pin output drivers are enable is not recommended since it may result in damage to the application circuits.

The PxA, PxB, PxC and PxD output latches may not be in the proper states when the PWM module is initialized. Enabling the PWM pin output drivers at the same time as the Enhanced PWM modes may cause damage to the application circuit.

The Enhanced PWM modes must be enabled in the proper Output mode and complete a full PWM cycle before enabling the PWM pin output drivers. The completion of a full PWM cycle is indicated by the TMRxIF bit of the PIR1, PIR2 or PIR5 register being set as the second PWM period begins.

Note:	When the microcontroller is released from Reset, all of the I/O pins are in the high-impedance state. The external circuits must keep the power switch devices in the Off state until the microcontroller drives the I/O pins with the proper signal levels or activates the PWM output(s).

FIGURE 14-19: EXAMPLE OF STEERING EVENT AT END OF INSTRUCTION (STRxSYNC = 0)

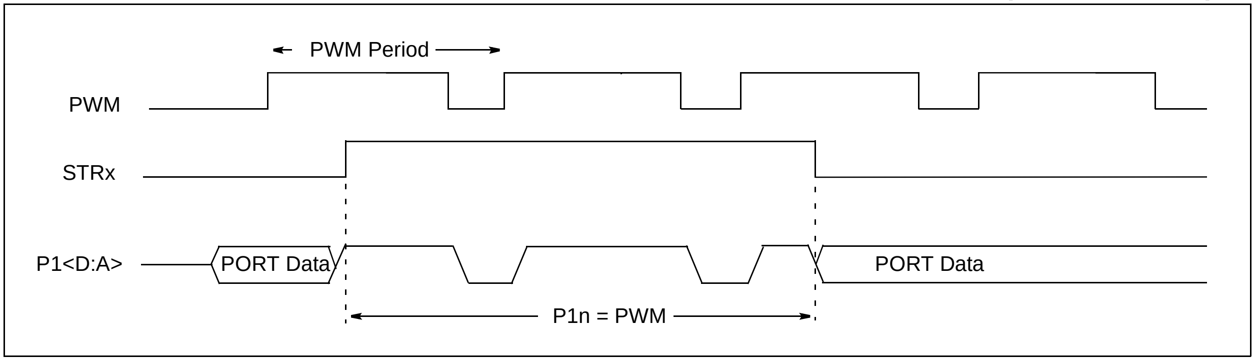

FIGURE 14-20: EXAMPLE OF STEERING EVENT AT BEGINNING OF INSTRUCTION (STRxSYNC = 1)

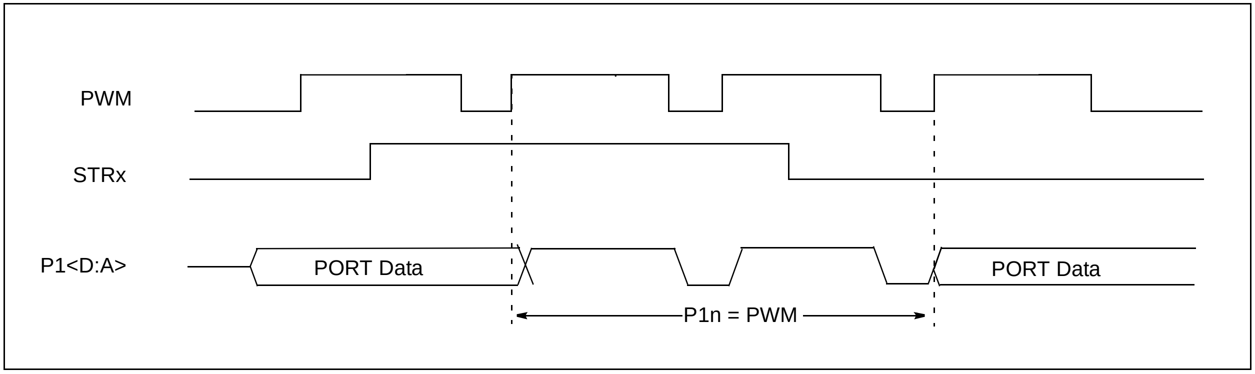

FIGURE 15-20: I²C SLAVE, 10-BIT ADDRESS, RECEPTION (SEN = 1, AHEN = 0, DHEN = 0)

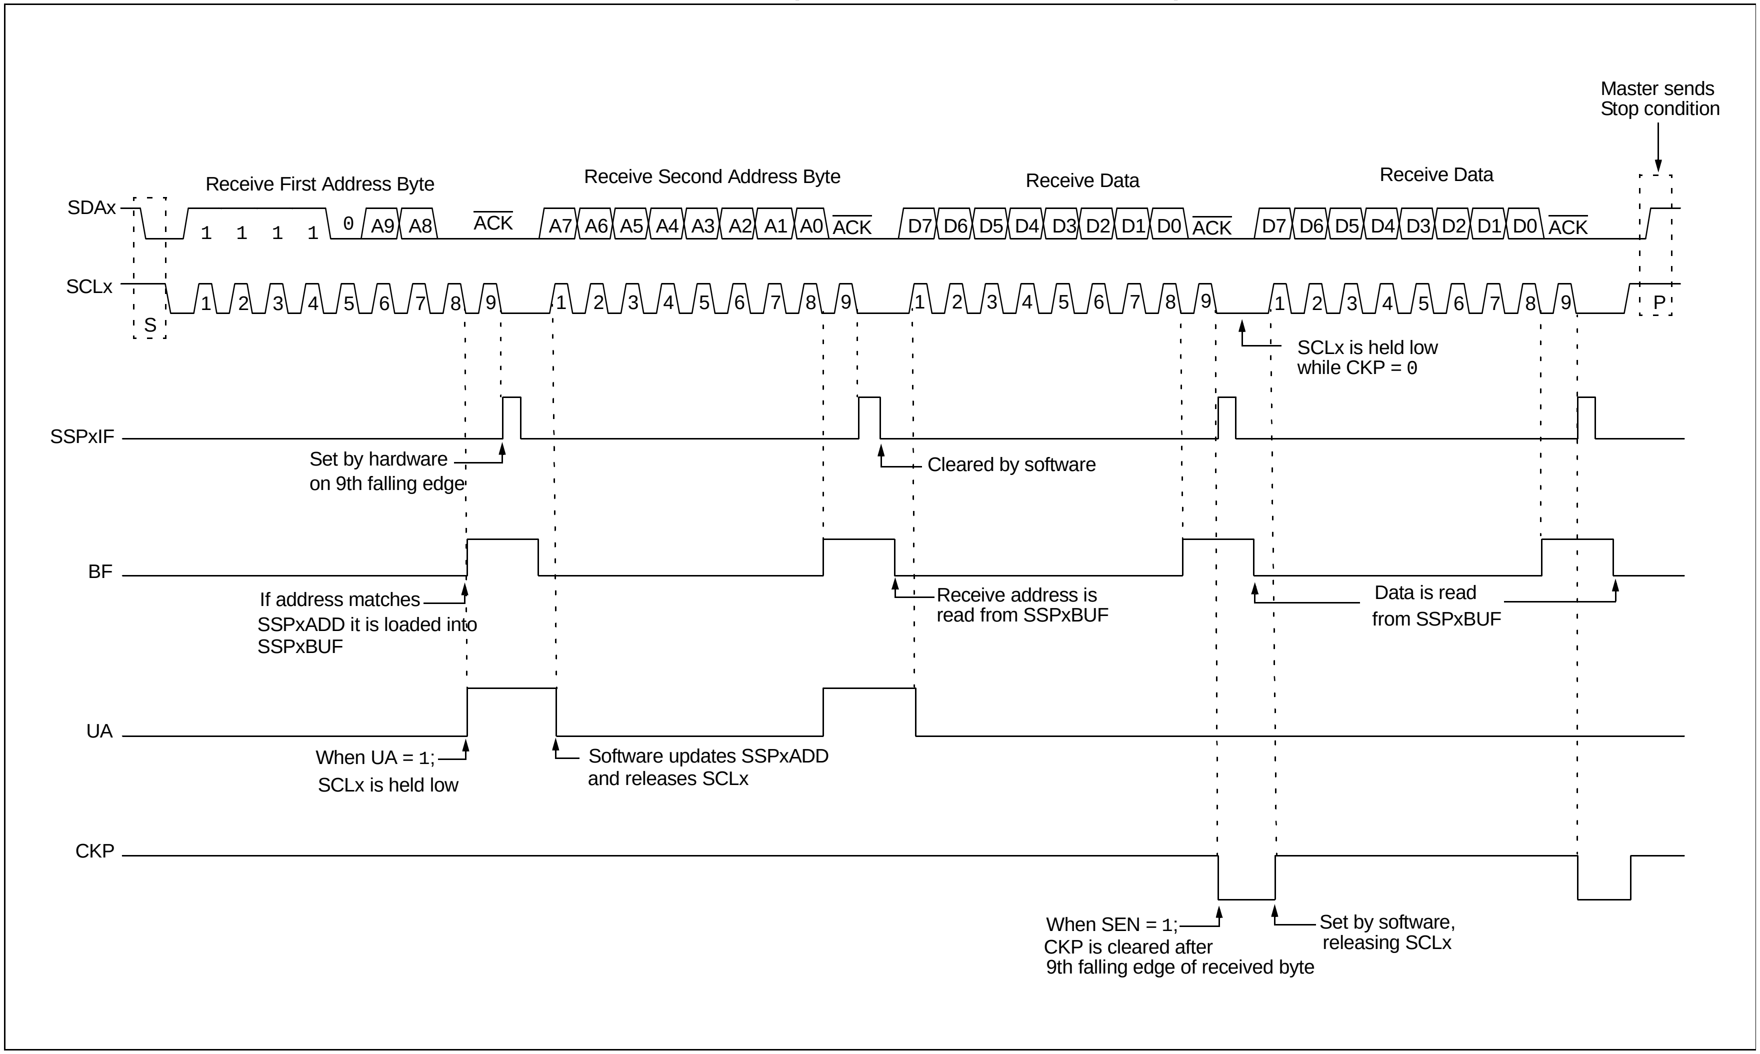

REGISTER 15-3: SSPxCON1: SSPx CONTROL REGISTER 1 (CONTINUED)

bit 3-0 **SSPxM<3:0>:** Synchronous Serial Port Mode Select bits

`0000` = SPI Master mode, clock = FOSC/4

`0001` = SPI Master mode, clock = FOSC/16

`0010` = SPI Master mode, clock = FOSC/64

`0011` = SPI Master mode, clock = TMR2 output/2

`0100` = SPI Slave mode, clock = SCKx pin, $\overline{\text{SSx}}$ pin control enabled

`0101` = SPI Slave mode, clock = SCKx pin, $\overline{\text{SSx}}$ pin control disabled, $\overline{\text{SSx}}$ can be used as I/O pin

`0110` = I^{2}C Slave mode, 7-bit address

`0111` = I^{2}C Slave mode, 10-bit address

`1000` = I^{2}C Master mode, clock = FOSC / (4 * (SSPxADD+1))**(4)**

`1001` = Reserved

`1010` = SPI Master mode, clock = FOSC/(4 * (SSPxADD+1))

`1011` = I^{2}C firmware controlled Master mode (slave idle)

`1100` = Reserved

`1101` = Reserved

`1110` = I^{2}C Slave mode, 7-bit address with Start and Stop bit interrupts enabled

`1111` = I^{2}C Slave mode, 10-bit address with Start and Stop bit interrupts enabled

Note 1: In Master mode, the overflow bit is not set since each new reception (and transmission) is initiated by writing to the SSPxBUF register.

2: When enabled, these pins must be properly configured as input or output.

3: When enabled, the SDAx and SCLx pins must be configured as inputs.

4: SSPxADD values of 0, 1 or 2 are not supported for I^{2}C mode.

16.1.2.9 Asynchronous Reception Setup:

1. Initialize the SPBRGHx:SPBRGx register pair and the BRGH and BRG16 bits to achieve the desired baud rate (see **Section 16.4 “EUSART Baud Rate Generator (BRG)”**).
2. Set the RXx/DTx and TXx/CKx TRIS controls to ‘1’.
3. Enable the serial port by setting the SPEN bit and the RXx/DTx pin TRIS bit. The SYNC bit must be clear for asynchronous operation.
4. If interrupts are desired, set the RCxIE interrupt enable bit and set the GIE/GIEH and PEIE/GIEL bits of the INTCON register.
5. If 9-bit reception is desired, set the RX9 bit.
6. Set the DTRXP if inverted receive polarity is desired.
7. Enable reception by setting the CREN bit.
8. The RCxIF interrupt flag bit will be set when a character is transferred from the RSR to the receive buffer. An interrupt will be generated if the RCxIE interrupt enable bit was also set.
9. Read the RCSTAx register to get the error flags and, if 9-bit data reception is enabled, the ninth data bit.
10. Get the received eight Least Significant data bits from the receive buffer by reading the RCREGx register.
11. If an overrun occurred, clear the OERR flag by clearing the CREN receiver enable bit.

16.1.2.10 9-bit Address Detection Mode Setup

This mode would typically be used in RS-485 systems. To set up an Asynchronous Reception with Address Detect Enable:

1. Initialize the SPBRGHx, SPBRGx register pair and the BRGH and BRG16 bits to achieve the desired baud rate (see **Section 16.4 “EUSART Baud Rate Generator (BRG)”**).
2. Set the RXx/DTx and TXx/CKx TRIS controls to ‘1’.
3. Enable the serial port by setting the SPEN bit. The SYNC bit must be clear for asynchronous operation.
4. If interrupts are desired, set the RCxIE interrupt enable bit and set the GIE/GIEH and PEIE/GIEL bits of the INTCON register.
5. Enable 9-bit reception by setting the RX9 bit.
6. Enable address detection by setting the ADDEN bit.
7. Set the DTRXP if inverted receive polarity is desired.
8. Enable reception by setting the CREN bit.
9. The RCxIF interrupt flag bit will be set when a character with the ninth bit set is transferred from the RSR to the receive buffer. An interrupt will be generated if the RCxIE interrupt enable bit was also set.
10. Read the RCSTAx register to get the error flags. The ninth data bit will always be set.
11. Get the received eight Least Significant data bits from the receive buffer by reading the RCREGx register. Software determines if this is the device’s address.
12. If an overrun occurred, clear the OERR flag by clearing the CREN receiver enable bit.
13. If the device has been addressed, clear the ADDEN bit to allow all received data into the receive buffer and generate interrupts.

19.4 Measuring Capacitance with the CTMU

There are two separate methods of measuring capacitance with the CTMU. The first is the absolute method, in which the actual capacitance value is desired. The second is the relative method, in which the actual capacitance is not needed, rather an indication of a change in capacitance is required.

19.4.1 ABSOLUTE CAPACITANCE MEASUREMENT

For absolute capacitance measurements, both the current and capacitance calibration steps found in **Section 19.3 "Calibrating the CTMU Module"** should be followed. Capacitance measurements are then performed using the following steps:

1. Initialize the A/D Converter.
2. Initialize the CTMU.
3. Set EDG1STAT.
4. Wait for a fixed delay, *T*.
5. Clear EDG1STAT.
6. Perform an A/D conversion.
7. Calculate the total capacitance, $C_{TOTAL} = (I * T)/V$, where *I* is known from the current source measurement step (see **Section 19.3.1 "Current Source Calibration"**), *T* is a fixed delay and *V* is measured by performing an A/D conversion.
8. Subtract the stray and A/D capacitance (C_{OFFSET} from **Section 19.3.2 "Capacitance Calibration"**) from C_{TOTAL} to determine the measured capacitance.

19.4.2 RELATIVE CHARGE MEASUREMENT

An application may not require precise capacitance measurements. For example, when detecting a valid press of a capacitance-based switch, detecting a relative change of capacitance is of interest. In this type of application, when the switch is open (or not touched), the total capacitance is the capacitance of the combination of the board traces, the A/D Converter, etc. A larger voltage will be measured by the A/D Converter. When the switch is closed (or is touched), the total capacitance is larger due to the addition of the capacitance of the human body to the above listed capacitances, and a smaller voltage will be measured by the A/D Converter.

Detecting capacitance changes is easily accomplished with the CTMU using these steps:

1. Initialize the A/D Converter and the CTMU.
2. Set EDG1STAT.
3. Wait for a fixed delay.
4. Clear EDG1STAT.
5. Perform an A/D conversion.

The voltage measured by performing the A/D conversion is an indication of the relative capacitance. Note that in this case, no calibration of the current source or circuit capacitance measurement is needed. See Example 19-4 for a sample software routine for a capacitive touch switch.

‘1’ = Bit is set	‘0’ = Bit is cleared	

bit 7 **FVREN:** Fixed Voltage Reference Enable bit
0 = Fixed Voltage Reference is disabled
1 = Fixed Voltage Reference is enabled

bit 6 **FVRST:** Fixed Voltage Reference Ready Flag bit
0 = Fixed Voltage Reference output is not ready or not enabled
1 = Fixed Voltage Reference output is ready for use

bit 5-4 **FVRS<1:0>:** Fixed Voltage Reference Selection bits
00 = Fixed Voltage Reference Peripheral output is off
01 = Fixed Voltage Reference Peripheral output is 1x (1.024V)
10 = Fixed Voltage Reference Peripheral output is 2x (2.048V)(1)
11 = Fixed Voltage Reference Peripheral output is 4x (4.096V)(1)

bit 3-2 **Reserved:** Read as ‘0’. Maintain these bits clear.

bit 1-0 **Unimplemented:** Read as ‘0’.

Note 1: Fixed Voltage Reference output cannot exceed VDD.

TABLE 21-1: SUMMARY OF REGISTERS ASSOCIATED WITH FIXED VOLTAGE REFERENCE

Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Register on Page
VREFCON0	FVREN	FVRST	FVRS<1:0>		—	—	—	—	332

Legend: — = unimplemented locations, read as ‘0’. Shaded bits are not used by the FVR module.

FIGURE 22-1: DIGITAL-TO-ANALOG CONVERTER BLOCK DIAGRAM

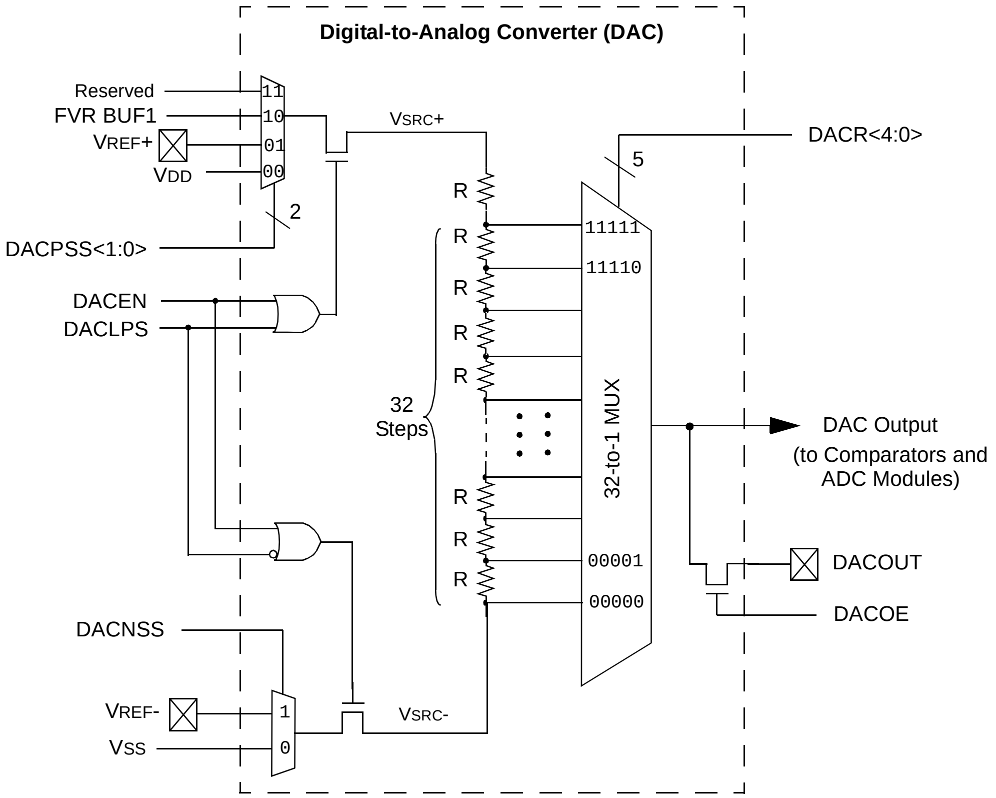

FIGURE 22-2: VOLTAGE REFERENCE OUTPUT BUFFER EXAMPLE

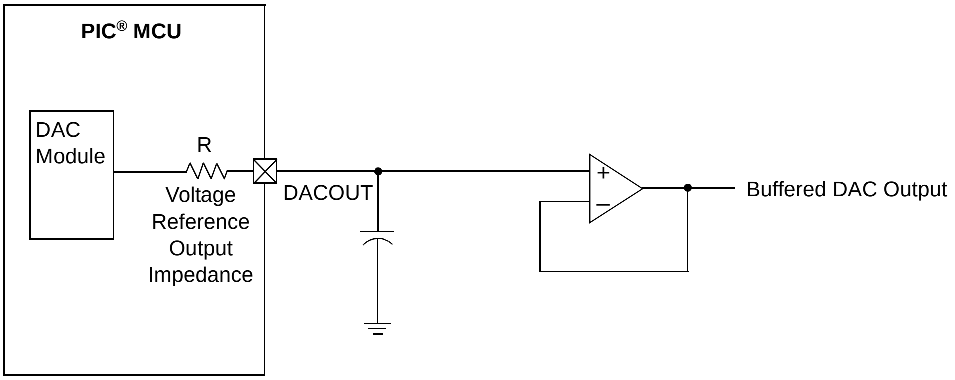

IORLW Inclusive OR literal with W

Syntax: IORLW k

Operands: $0 \le k \le 255$

Operation: (W) .OR. k → W

Status Affected: N, Z

Encoding:

0000	1001	kkkk	kkkk

Description: The contents of W are ORed with the 8-bit literal ‘k’. The result is placed in W.

Words: 1

Cycles: 1

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read literal ‘k’	Process Data	Write to W

Example: `IORLW 35h`

Before Instruction
W = 9Ah
After Instruction
W = BFh

IORWF Inclusive OR W with f

Syntax: IORWF f {,d {,a}}

Operands: $0 \le f \le 255$
$d \in [0,1]$
$a \in [0,1]$

Operation: (W) .OR. (f) → dest

Status Affected: N, Z

Encoding:

0001	00da	ffff	ffff

Description: Inclusive OR W with register ‘f’. If ‘d’ is ‘0’, the result is placed in W. If ‘d’ is ‘1’, the result is placed back in register ‘f’ (default).
If ‘a’ is ‘0’, the Access Bank is selected. If ‘a’ is ‘1’, the BSR is used to select the GPR bank.
If ‘a’ is ‘0’ and the extended instruction set is enabled, this instruction operates in Indexed Literal Offset Addressing mode whenever $f \le 95$ (5Fh). See **Section 25.2.3 “Byte-Oriented and Bit-Oriented Instructions in Indexed Literal Offset Mode”** for details.

Words: 1

Cycles: 1

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register ‘f’	Process Data	Write to destination

Example: `IORWF RESULT, 0, 1`

Before Instruction
RESULT = 13h
W = 91h
After Instruction
RESULT = 13h
W = 93h

SUBWFB — Subtract W from f with Borrow

Syntax: SUBWFB f {,d {,a}}

Operands: $0 \le f \le 255$
$d \in [0,1]$
$a \in [0,1]$

Operation: (f) – (W) – ($\overline{C}$) → dest

Status Affected: N, OV, C, DC, Z

Encoding:

0101	10da	ffff	ffff

Description: Subtract W and the CARRY flag (borrow) from register ‘f’ (2’s complement method). If ‘d’ is ‘0’, the result is stored in W. If ‘d’ is ‘1’, the result is stored back in register ‘f’ (default).
If ‘a’ is ‘0’, the Access Bank is selected. If ‘a’ is ‘1’, the BSR is used to select the GPR bank.
If ‘a’ is ‘0’ and the extended instruction set is enabled, this instruction operates in Indexed Literal Offset Addressing mode whenever $f \le 95$ (5Fh). See **Section 25.2.3 “Byte-Oriented and Bit-Oriented Instructions in Indexed Literal Offset Mode”** for details.

Words: 1

Cycles: 1

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register ‘f’	Process Data	Write to destination

Example 1: SUBWFB REG, 1, 0

```
Before Instruction
    REG   =   19h    (0001 1001)
    W     =   0Dh    (0000 1101)
    C     =   1
After Instruction
    REG   =   0Ch    (0000 1100)
    W     =   0Dh    (0000 1101)
    C     =   1
    Z     =   0
    N     =   0      ; result is positive
```

Example 2: SUBWFB REG, 0, 0

```
Before Instruction
    REG   =   1Bh    (0001 1011)
    W     =   1Ah    (0001 1010)
    C     =   0
After Instruction
    REG   =   1Bh    (0001 1011)
    W     =   00h
    C     =   1
    Z     =   1      ; result is zero
    N     =   0
```

Example 3: SUBWFB REG, 1, 0

```
Before Instruction
    REG   =   03h    (0000 0011)
    W     =   0Eh    (0000 1110)
    C     =   1
After Instruction
    REG   =   F5h    (1111 0101)
                     ; [2’s comp]
    W     =   0Eh    (0000 1110)
    C     =   0
    Z     =   0
    N     =   1      ; result is negative
```

SWAPF — Swap f

Syntax: SWAPF f {,d {,a}}

Operands: $0 \le f \le 255$
$d \in [0,1]$
$a \in [0,1]$

Operation: (f<3:0>) → dest<7:4>,
(f<7:4>) → dest<3:0>

Status Affected: None

Encoding:

0011	10da	ffff	ffff

Description: The upper and lower nibbles of register ‘f’ are exchanged. If ‘d’ is ‘0’, the result is placed in W. If ‘d’ is ‘1’, the result is placed in register ‘f’ (default).
If ‘a’ is ‘0’, the Access Bank is selected. If ‘a’ is ‘1’, the BSR is used to select the GPR bank.
If ‘a’ is ‘0’ and the extended instruction set is enabled, this instruction operates in Indexed Literal Offset Addressing mode whenever $f \le 95$ (5Fh). See **Section 25.2.3 “Byte-Oriented and Bit-Oriented Instructions in Indexed Literal Offset Mode”** for details.

Words: 1

Cycles: 1

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register ‘f’	Process Data	Write to destination

Example: SWAPF REG, 1, 0

```
Before Instruction
    REG   =   53h
After Instruction
    REG   =   35h
```

TBLRD Table Read

Syntax: TBLRD (*; *+; *-; +*)

Operands: None

Operation:
if TBLRD *,
(Prog Mem (TBLPTR)) → TABLAT;
TBLPTR – No Change;
if TBLRD *+,
(Prog Mem (TBLPTR)) → TABLAT;
(TBLPTR) + 1 → TBLPTR;
if TBLRD *-,
(Prog Mem (TBLPTR)) → TABLAT;
(TBLPTR) – 1 → TBLPTR;
if TBLRD +*,
(TBLPTR) + 1 → TBLPTR;
(Prog Mem (TBLPTR)) → TABLAT;

Status Affected: None

Encoding:

0000	0000	0000	10nn nn=0 * =1 *+ =2 *- =3 +*

Description: This instruction is used to read the contents of Program Memory (P.M.). To address the program memory, a pointer called Table Pointer (TBLPTR) is used.
The TBLPTR (a 21-bit pointer) points to each byte in the program memory. TBLPTR has a 2-Mbyte address range.

TBLPTR[0] = 0:	Least Significant Byte of Program Memory Word
TBLPTR[0] = 1:	Most Significant Byte of Program Memory Word

The TBLRD instruction can modify the value of TBLPTR as follows:

- no change
- post-increment
- post-decrement
- pre-increment

Words: 1

Cycles: 2

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	No operation	No operation	No operation
No operation	No operation (Read Program Memory)	No operation	No operation (Write TABLAT)

TBLRD Table Read (Continued)

Example1: `TBLRD *+ ;`

Before Instruction

TABLAT	=	55h
TBLPTR	=	00A356h
MEMORY (00A356h)	=	34h

After Instruction

TABLAT	=	34h
TBLPTR	=	00A357h

Example2: `TBLRD +* ;`

Before Instruction

TABLAT	=	AAh
TBLPTR	=	01A357h
MEMORY (01A357h)	=	12h
MEMORY (01A358h)	=	34h

After Instruction

TABLAT	=	34h
TBLPTR	=	01A358h
