Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Obsolete
Core Processor	PowerPC e300
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	533MHz
Co-Processors/DSP	-
RAM Controllers	DDR, DDR2
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100/1000Mbps (2)
SATA	-
USB	USB 2.0 + PHY (2)
Voltage - I/O	1.8V, 2.5V, 3.3V
Operating Temperature	0°C ~ 105°C (TA)
Security Features	-
Package / Case	672-LBGA
Supplier Device Package	672-LBGA (35x35)
Purchase URL	https://www.e-xfl.com/product-detail/nxp-semiconductors/kmpc8349zuajfb

- Double data rate, DDR1/DDR2 SDRAM memory controller
  - Programmable timing supporting DDR1 and DDR2 SDRAM
  - 32- or 64-bit data interface, up to 400 MHz data rate
  - Up to four physical banks (chip selects), each bank up to 1 Gbyte independently addressable
  - DRAM chip configurations from 64 Mbits to 1 Gbit with ×8/×16 data ports
  - Full error checking and correction (ECC) support
  - Support for up to 16 simultaneous open pages (up to 32 pages for DDR2)
  - Contiguous or discontiguous memory mapping
  - Read-modify-write support
  - Sleep-mode support for SDRAM self refresh
  - Auto refresh
  - On-the-fly power management using CKE
  - Registered DIMM support
  - 2.5-V SSTL2 compatible I/O for DDR1, 1.8-V SSTL2 compatible I/O for DDR2
- Dual three-speed (10/100/1000) Ethernet controllers (TSECs)
  - Dual controllers designed to comply with IEEE 802.3™, 802.3u™, 820.3x™, 802.3z™, 802.3ac™ standards
  - Ethernet physical interfaces:
    - 1000 Mbps IEEE Std. 802.3 GMII/RGMII, IEEE Std. 802.3z TBI/RTBI, full-duplex
    - 10/100 Mbps IEEE Std. 802.3 MII full- and half-duplex
  - Buffer descriptors are backward-compatible with MPC8260 and MPC860T 10/100 programming models
  - 9.6-Kbyte jumbo frame support
  - RMON statistics support
  - Internal 2-Kbyte transmit and 2-Kbyte receive FIFOs per TSEC module
  - MII management interface for control and status
  - Programmable CRC generation and checking
- Dual PCI interfaces
  - Designed to comply with *PCI Specification Revision 2.3*
  - Data bus width options:
    - Dual 32-bit data PCI interfaces operating at up to 66 MHz
    - Single 64-bit data PCI interface operating at up to 66 MHz
  - PCI 3.3-V compatible
  - PCI host bridge capabilities on both interfaces
  - PCI agent mode on PCI1 interface
  - PCI-to-memory and memory-to-PCI streaming
  - Memory prefetching of PCI read accesses and support for delayed read transactions
  - Posting of processor-to-PCI and PCI-to-memory writes

- Dual industry-standard I^2C interfaces
  - — Two-wire interface
  - — Multiple master support
  - — Master or slave I^2C mode support
  - — On-chip digital filtering rejects spikes on the bus
  - — System initialization data optionally loaded from I^2C-1 EPROM by boot sequencer embedded hardware
- DMA controller
  - — Four independent virtual channels
  - — Concurrent execution across multiple channels with programmable bandwidth control
  - — Handshaking (external control) signals for all channels: $\overline{\text{DMA\_DREQ}}$[0:3], $\overline{\text{DMA\_DACK}}$[0:3], $\overline{\text{DMA\_DDONE}}$[0:3]
  - — All channels accessible to local core and remote PCI masters
  - — Misaligned transfer capability
  - — Data chaining and direct mode
  - — Interrupt on completed segment and chain
- DUART
  - — Two 4-wire interfaces (RxD, TxD, RTS, CTS)
  - — Programming model compatible with the original 16450 UART and the PC16550D
- Serial peripheral interface (SPI) for master or slave
- General-purpose parallel I/O (GPIO)
  - — 64 parallel I/O pins multiplexed on various chip interfaces
- System timers
  - — Periodic interrupt timer
  - — Real-time clock
  - — Software watchdog timer
  - — Eight general-purpose timers
- Designed to comply with IEEE Std. 1149.1™, JTAG boundary scan
- Integrated PCI bus and SDRAM clock generation

2 Electrical Characteristics

This section provides the AC and DC electrical specifications and thermal characteristics for the MPC8349EA. The device is currently targeted to these specifications. Some of these specifications are independent of the I/O cell, but are included for a more complete reference. These are not purely I/O buffer design specifications.

2.1 Overall DC Electrical Characteristics

This section covers the ratings, conditions, and other characteristics.

2.1.1 Absolute Maximum Ratings

Table 1 provides the absolute maximum ratings.

Table 1. Absolute Maximum Ratings[1]

Parameter		Symbol	Max Value	Unit	Notes
Core supply voltage		V_{DD}	–0.3 to 1.32 (1.36 max for 667-MHz core frequency)	V	—
PLL supply voltage		AV_{DD}	–0.3 to 1.32 (1.36 max for 667-MHz core frequency)	V	—
DDR and DDR2 DRAM I/O voltage		GV_{DD}	–0.3 to 2.75 –0.3 to 1.98	V	—
Three-speed Ethernet I/O, MII management voltage		LV_{DD}	–0.3 to 3.63	V	—
PCI, local bus, DUART, system control and power management, I^2C, and JTAG I/O voltage		OV_{DD}	–0.3 to 3.63	V	—
Input voltage	DDR DRAM signals	MV_{IN}	–0.3 to (GV_{DD} + 0.3)	V	2, 5
	DDR DRAM reference	MV_{REF}	–0.3 to (GV_{DD} + 0.3)	V	2, 5
	Three-speed Ethernet signals	LV_{IN}	–0.3 to (LV_{DD} + 0.3)	V	4, 5
	Local bus, DUART, CLKIN, system control and power management, I^2C, and JTAG signals	OV_{IN}	–0.3 to (OV_{DD} + 0.3)	V	3, 5
	PCI	OV_{IN}	–0.3 to (OV_{DD} + 0.3)	V	6
Storage temperature range		T_{STG}	–55 to 150	°C	—

Notes:

[1] Functional and tested operating conditions are given in Table 2. Absolute maximum ratings are stress ratings only, and functional operation at the maximums is not guaranteed. Stresses beyond those listed may affect device reliability or cause permanent damage to the device.

[2] **Caution:** MV_{IN} must not exceed GV_{DD} by more than 0.3 V. This limit can be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.

[3] **Caution:** OV_{IN} must not exceed OV_{DD} by more than 0.3 V. This limit can be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.

[4] **Caution:** LV_{IN} must not exceed LV_{DD} by more than 0.3 V. This limit can be exceeded for a maximum of 20 ms during power-on reset and power-down sequences.

[5] (M,L,O)V_{IN} and MV_{REF} may overshoot/undershoot to a voltage and for a maximum duration as shown in Figure 2.

6 OVIN on the PCI interface can overshoot/undershoot according to the PCI Electrical Specification for 3.3-V operation, as shown in Figure 3.

2.1.2 Power Supply Voltage Specification

Table 2 provides the recommended operating conditions for the MPC8349EA. Note that the values in Table 2 are the recommended and tested operating conditions. Proper device operation outside these conditions is not guaranteed.

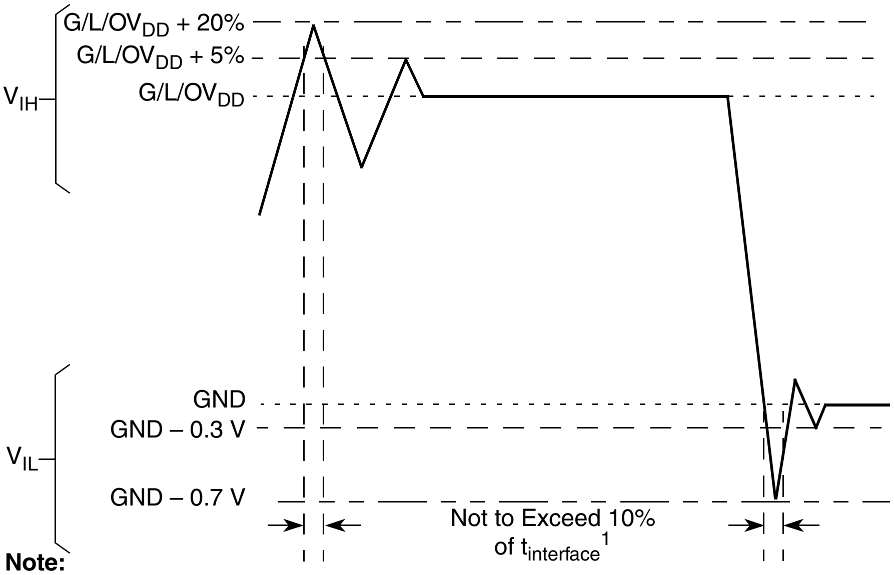
Table 2. Recommended Operating Conditions

Parameter	Symbol	Recommended Value	Unit	Notes
Core supply voltage for 667-MHz core frequency	V_{DD}	1.3 V ± 60 mV	V	1
Core supply voltage	V_{DD}	1.2 V ± 60 mV	V	1
PLL supply voltage for 667-MHz core frequency	AV_{DD}	1.3 V ± 60 mV	V	1
PLL supply voltage	AV_{DD}	1.2 V ± 60 mV	V	1
DDR and DDR2 DRAM I/O voltage	GV_{DD}	2.5 V ± 125 mV 1.8 V ± 90 mV	V	—
Three-speed Ethernet I/O supply voltage	LV_{DD1}	3.3 V ± 330 mV 2.5 V ± 125 mV	V	—
Three-speed Ethernet I/O supply voltage	LV_{DD2}	3.3 V ± 330 mV 2.5 V ± 125 mV	V	—
PCI, local bus, DUART, system control and power management, I^2C, and JTAG I/O voltage	OV_{DD}	3.3 V ± 330 mV	V	—

Note:

[1] GV_{DD}, LV_{DD}, OV_{DD}, AV_{DD}, and V_{DD} must track each other and must vary in the same direction—either in the positive or negative direction.

Figure 2 shows the undershoot and overshoot voltages at the interfaces of the MPC8349EA.



Note:

1. $t_{interface}$ refers to the clock period associated with the bus clock interface.

Figure 2. Overshoot/Undershoot Voltage for $GV_{DD}/OV_{DD}/LV_{DD}$

8.2.1.1 GMII Transmit AC Timing Specifications

Table 25 provides the GMII transmit AC timing specifications.

Table 25. GMII Transmit AC Timing Specifications

At recommended operating conditions with LV_{DD}/OV_{DD} of 3.3 V ± 10%.

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit
GTX_CLK clock period	t_{GTX}	—	8.0	—	ns
GTX_CLK duty cycle	t_{GTXH}/t_{GTX}	43.75	—	56.25	%
GTX_CLK to GMII data TXD[7:0], TX_ER, TX_EN delay	t_{GTKHDX}	0.5	—	5.0	ns
GTX_CLK clock rise time (20%–80%)	t_{GTXR}	—	—	1.0	ns
GTX_CLK clock fall time (80%–20%)	t_{GTXF}	—	—	1.0	ns

Notes:

1. The symbols for timing specifications follow the pattern $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{GTKHDV} symbolizes GMII transmit timing (GT) with respect to the t_{GTX} clock reference (K) going to the high state (H) relative to the time date input signals (D) reaching the valid state (V) to state or setup time. Also, t_{GTKHDX} symbolizes GMII transmit timing (GT) with respect to the t_{GTX} clock reference (K) going to the high state (H) relative to the time date input signals (D) going invalid (X) or hold time. In general, the clock reference symbol is based on three letters representing the clock of a particular function. For example, the subscript of t_{GTX} represents the GMII(G) transmit (TX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).

Figure 9 shows the GMII transmit AC timing diagram.

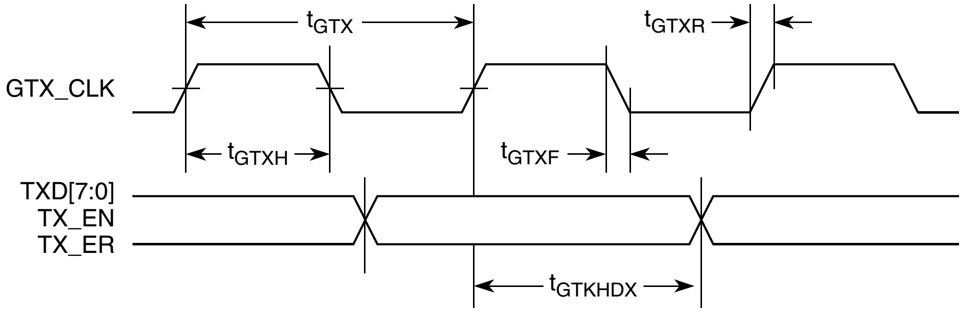


Figure 9. GMII Transmit AC Timing Diagram

8.2.1.2 GMII Receive AC Timing Specifications

Table 26 provides the GMII receive AC timing specifications.

Table 26. GMII Receive AC Timing Specifications

At recommended operating conditions with LV_{DD}/OV_{DD} of 3.3 V ± 10%.

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit
RX_CLK clock period	t_{GRX}	—	8.0	—	ns
RX_CLK duty cycle	t_{GRXH}/t_{GRX}	40	—	60	%
RXD[7:0], RX_DV, RX_ER setup time to RX_CLK	t_{GRDVKH}	2.0	—	—	ns
RXD[7:0], RX_DV, RX_ER hold time to RX_CLK	t_{GRDXKH}	0.5	—	—	ns

8.2.3.1 TBI Transmit AC Timing Specifications

Table 29 provides the TBI transmit AC timing specifications.

Table 29. TBI Transmit AC Timing Specifications

At recommended operating conditions with LV_{DD}/OV_{DD} of 3.3 V ± 10%.

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit
GTX_CLK clock period	t_{TTX}	—	8.0	—	ns
GTX_CLK duty cycle	t_{TTXH}/t_{TTX}	40	—	60	%
GTX_CLK to TBI data TXD[7:0], TX_ER, TX_EN delay	t_{TTKHDX}	1.0	—	5.0	ns
GTX_CLK clock rise (20%–80%)	t_{TTXR}	—	—	1.0	ns
GTX_CLK clock fall time (80%–20%)	t_{TTXF}	—	—	1.0	ns

Notes:

1. The symbols for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{TTKHDV} symbolizes the TBI transmit timing (TT) with respect to the time from t_{TTX} (K) going high (H) until the referenced data signals (D) reach the valid state (V) or setup time. Also, t_{TTKHDX} symbolizes the TBI transmit timing (TT) with respect to the time from t_{TTX} (K) going high (H) until the referenced data signals (D) reach the invalid state (X) or hold time. In general, the clock reference symbol is based on three letters representing the clock of a particular function. For example, the subscript of t_{TTX} represents the TBI (T) transmit (TX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).

Figure 14 shows the TBI transmit AC timing diagram.

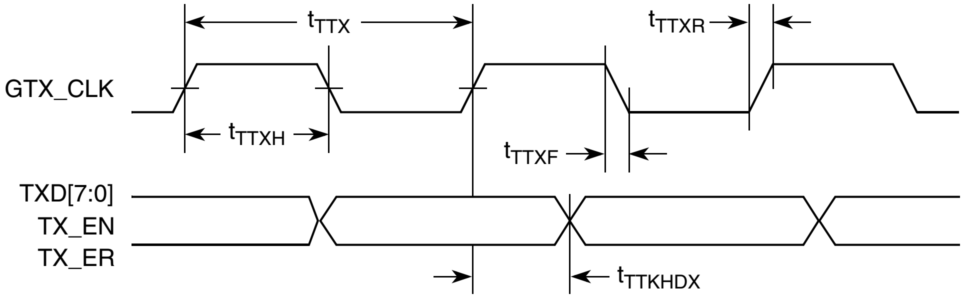

Figure 14. TBI Transmit AC Timing Diagram

8.2.3.2 TBI Receive AC Timing Specifications

Table 30 provides the TBI receive AC timing specifications.

Table 30. TBI Receive AC Timing Specifications

At recommended operating conditions with LV_{DD}/OV_{DD} of 3.3 V ± 10%.

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit
PMA_RX_CLK clock period	t_{TRX}		16.0		ns
PMA_RX_CLK skew	t_{SKTRX}	7.5	—	8.5	ns
RX_CLK duty cycle	t_{TRXH}/t_{TRX}	40	—	60	%

Figure 21 through Figure 26 show the local bus signals.

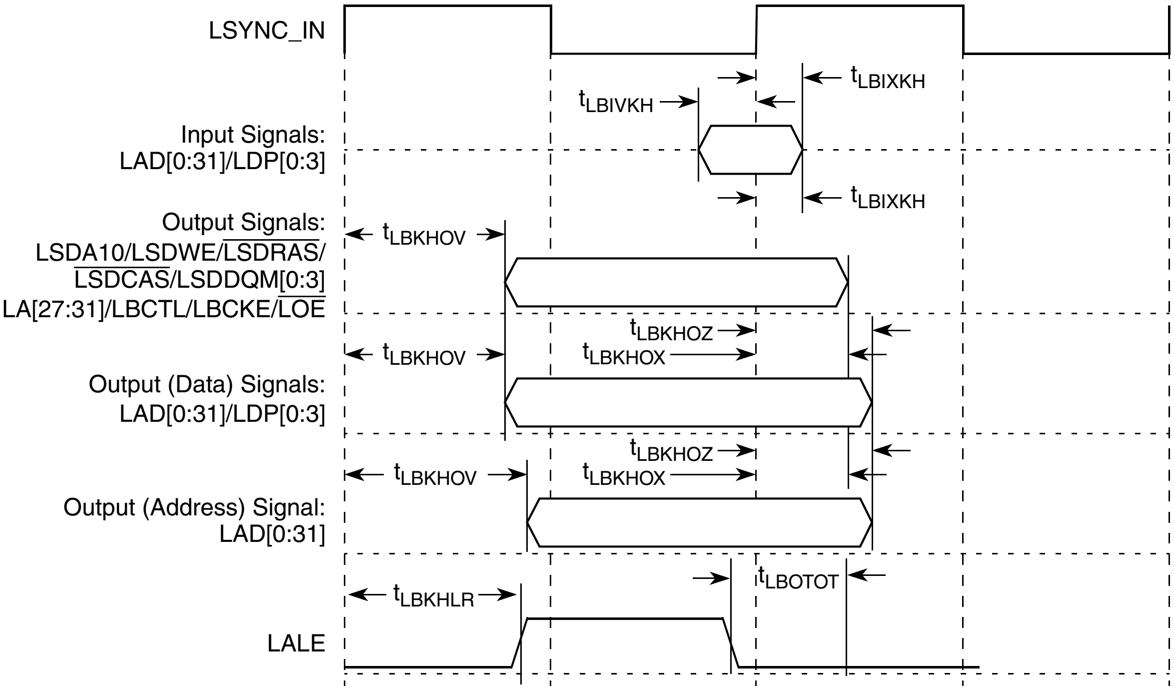

Figure 21. Local Bus Signals, Nonspecial Signals Only (DLL Enabled)

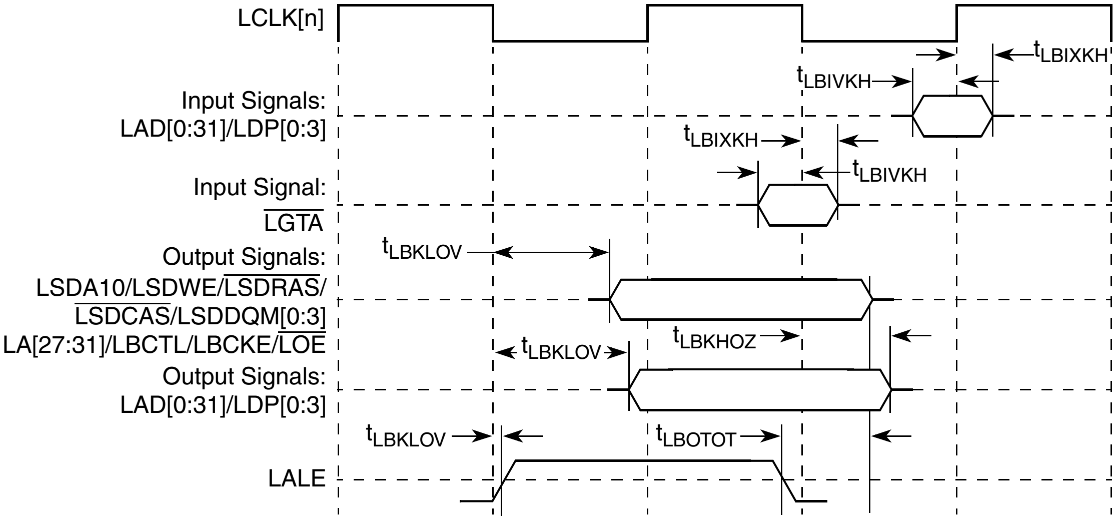

Figure 22. Local Bus Signals, Nonspecial Signals Only (DLL Bypass Mode)

Table 41. JTAG AC Timing Specifications (Independent of CLKIN)[1] (continued)

At recommended operating conditions (see Table 2).

Parameter	Symbol[2]	Min	Max	Unit	Notes
JTAG external clock to output high impedance: Boundary-scan data TDO	 t_{JTKLDZ} t_{JTKLOZ}	 2 2	 19 9	ns	5, 6

Notes:

1. All outputs are measured from the midpoint voltage of the falling/rising edge of t_{TCLK} to the midpoint of the signal in question. The output timings are measured at the pins. All output timings assume a purely resistive 50 Ω load (see Figure 18). Time-of-flight delays must be added for trace lengths, vias, and connectors in the system.
2. The symbols for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{JTDVKH} symbolizes JTAG device timing (JT) with respect to the time data input signals (D) reaching the valid state (V) relative to the t_{JTG} clock reference (K) going to the high (H) state or setup time. Also, t_{JTDXKH} symbolizes JTAG timing (JT) with respect to the time data input signals (D) went invalid (X) relative to the t_{JTG} clock reference (K) going to the high (H) state. In general, the clock reference symbol is based on three letters representing the clock of a particular function. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
3. $\overline{\text{TRST}}$ is an asynchronous level sensitive signal. The setup time is for test purposes only.
4. Non-JTAG signal input timing with respect to t_{TCLK}.
5. Non-JTAG signal output timing with respect to t_{TCLK}.
6. Guaranteed by design and characterization.

Figure 27 provides the AC test load for TDO and the boundary-scan outputs of the MPC8349EA.

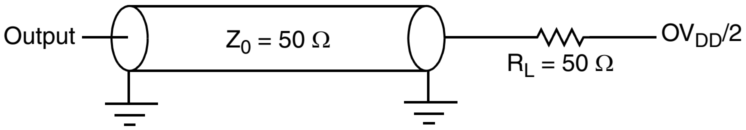

Figure 27. AC Test Load for the JTAG Interface

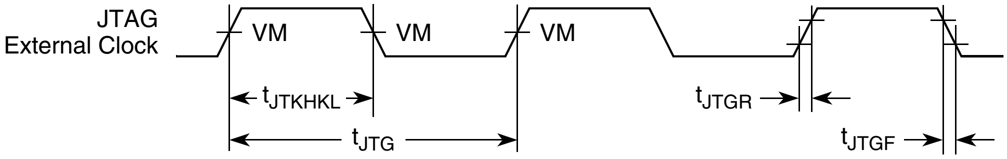
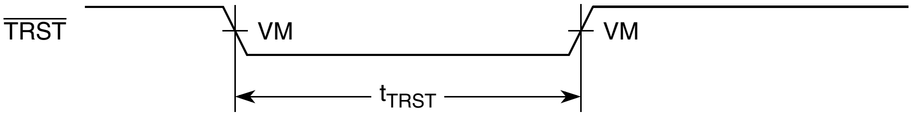
Figure 28 provides the JTAG clock input timing diagram.



VM = Midpoint Voltage (OV_{DD}/2)

Figure 28. JTAG Clock Input Timing Diagram

Figure 29 provides the $\overline{\text{TRST}}$ timing diagram.



VM = Midpoint Voltage (OV_{DD}/2)

Figure 29. $\overline{\text{TRST}}$ Timing Diagram

13 PCI

This section describes the DC and AC electrical specifications for the PCI bus of the MPC8349EA.

13.1 PCI DC Electrical Characteristics

Table 44 provides the DC electrical characteristics for the PCI interface of the MPC8349EA.

Table 44. PCI DC Electrical Characteristics

Parameter	Symbol	Test Condition	Min	Max	Unit
High-level input voltage	V_{IH}	$V_{OUT} \geq V_{OH}$ (min) or $V_{OUT} \leq V_{OL}$ (max)	2	$OV_{DD} + 0.3$	V
Low-level input voltage	V_{IL}		–0.3	0.8	V
Input current	I_{IN}	$V_{IN}{}^1 = 0$ V or $V_{IN} = OV_{DD}$	—	±5	μA
High-level output voltage	V_{OH}	OV_{DD} = min, $I_{OH} = –100$ μA	$OV_{DD} – 0.2$	—	V
Low-level output voltage	V_{OL}	OV_{DD} = min, $I_{OL} = 100$ μA	—	0.2	V

Note:

1. The symbol V_{IN}, in this case, represents the OV_{IN} symbol referenced in Table 1.

13.2 PCI AC Electrical Specifications

This section describes the general AC timing parameters of the PCI bus of the MPC8349EA. Note that the PCI_CLK or PCI_SYNC_IN signal is used as the PCI input clock depending on whether the device is configured as a host or agent device. Table 45 provides the PCI AC timing specifications at 66 MHz.

Table 45. PCI AC Timing Specifications at 66 MHz[1]

Parameter	Symbol[2]	Min	Max	Unit	Notes
Clock to output valid	t_{PCKHOV}	—	6.0	ns	3
Output hold from clock	t_{PCKHOX}	1	—	ns	3
Clock to output high impedance	t_{PCKHOZ}	—	14	ns	3, 4
Input setup to clock	t_{PCIVKH}	3.0	—	ns	3, 5
Input hold from clock	t_{PCIXKH}	0	—	ns	3, 5
$\overline{\text{REQ64}}$ to $\overline{\text{PORESET}}$ setup time	t_{PCRVRH}	5	—	clocks	6

Figure 37 provides the AC test load for the SPI.

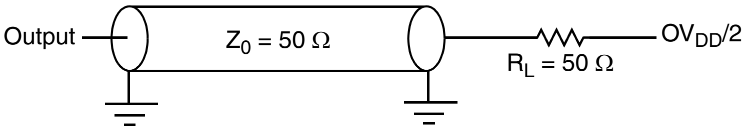


Figure 37. SPI AC Test Load

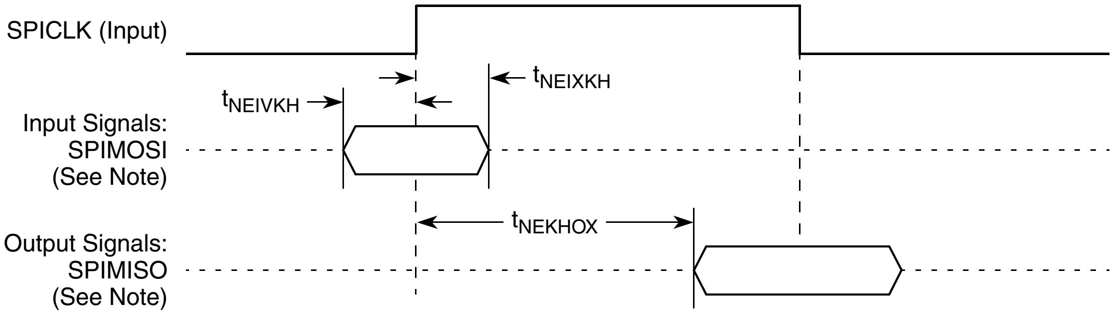
Figure 38 and Figure 39 represent the AC timings from Table 54. Note that although the specifications generally reference the rising edge of the clock, these AC timing diagrams also apply when the falling edge is the active edge.

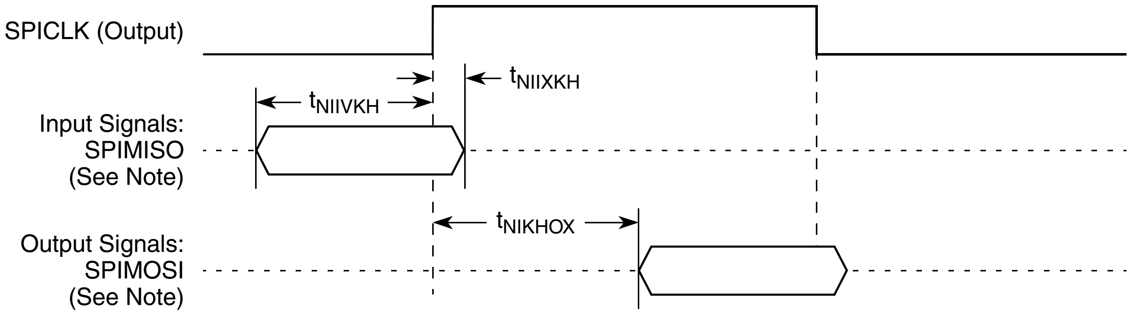
Figure 38 shows the SPI timings in slave mode (external clock).



Note: The clock edge is selectable on SPI.

Figure 38. SPI AC Timing in Slave Mode (External Clock) Diagram

Figure 39 shows the SPI timings in master mode (internal clock).



Note: The clock edge is selectable on SPI.

Figure 39. SPI AC Timing in Master Mode (Internal Clock) Diagram

18 Package and Pin Listings

This section details package parameters, pin assignments, and dimensions. The MPC8349EA is available in a tape ball grid array (TBGA). See Section 18.1, “Package Parameters for the MPC8349EA TBGA” and Section 18.2, “Mechanical Dimensions for the MPC8349EA TBGA.

19 Clocking

Figure 41 shows the internal distribution of the clocks.

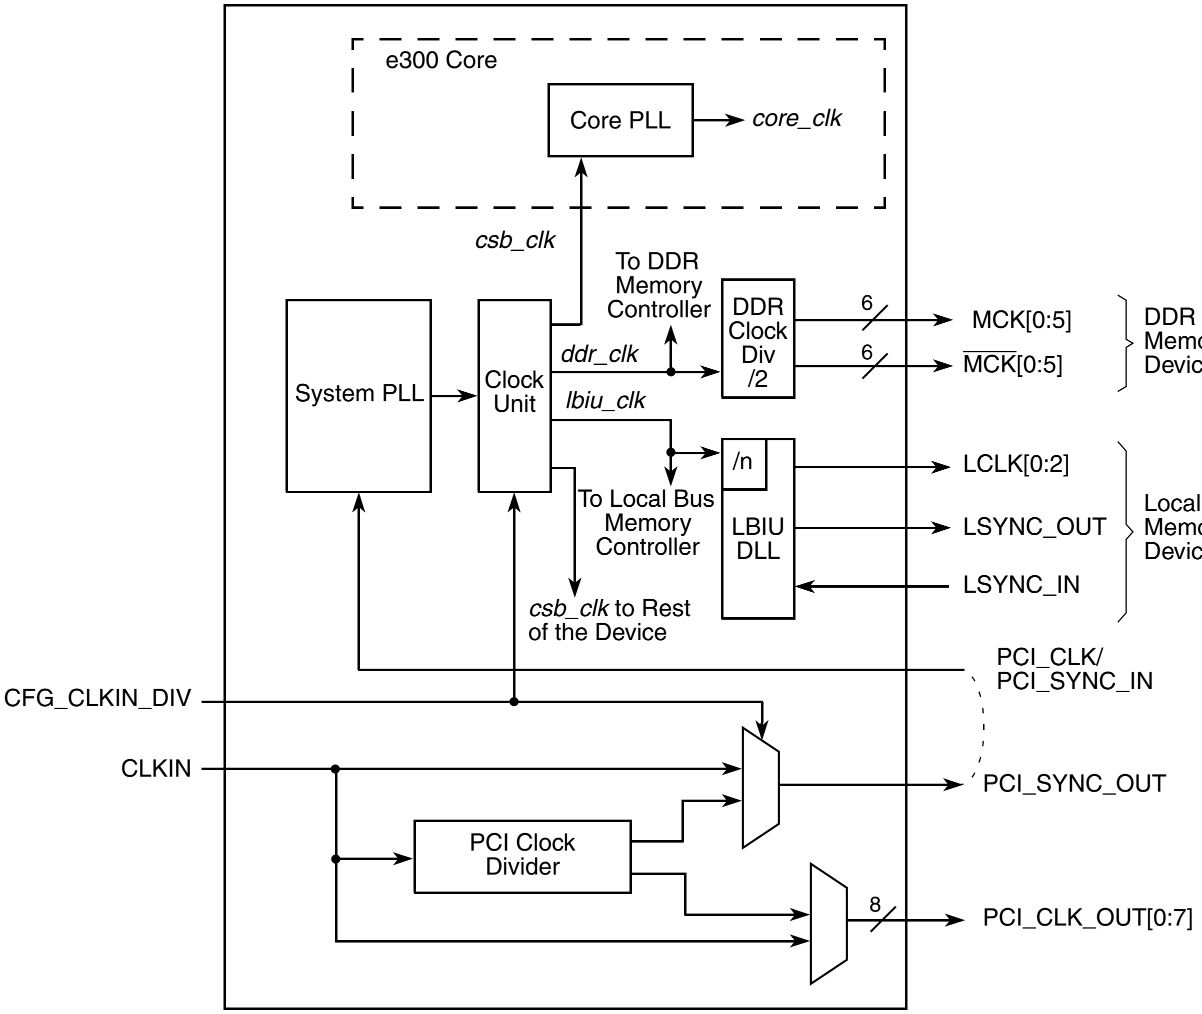

Figure 41. MPC8349EA Clock Subsystem

The primary clock source can be one of two inputs, CLKIN or PCI_CLK, depending on whether the device is configured in PCI host or PCI agent mode. When the MPC8349EA is configured as a PCI host device, CLKIN is its primary input clock. CLKIN feeds the PCI clock divider (÷2) and the multiplexors for PCI_SYNC_OUT and PCI_CLK_OUT. The CFG_CLKIN_DIV configuration input selects whether CLKIN or CLKIN/2 is driven out on the PCI_SYNC_OUT signal. The OCCR[PCICD*n*] parameters select whether CLKIN or CLKIN/2 is driven out on the PCI_CLK_OUT*n* signals.

PCI_SYNC_OUT is connected externally to PCI_SYNC_IN to allow the internal clock subsystem to synchronize to the system PCI clocks. PCI_SYNC_OUT must be connected properly to PCI_SYNC_IN, with equal delay to all PCI agent devices in the system, to allow the MPC8349EA to function. When the device is configured as a PCI agent device, PCI_CLK is the primary input clock and the CLKIN signal should be tied to GND.

Table 58. System PLL Multiplication Factors (continued)

RCWL[SPMF]	System PLL Multiplication Factor
0111	× 7
1000	× 8
1001	× 9
1010	× 10
1011	× 11
1100	× 12
1101	× 13
1110	× 14
1111	× 15

As described in Section 19, "Clocking," the LBIUCM, DDRCM, and SPMF parameters in the reset configuration word low and the CFG_CLKIN_DIV configuration input signal select the ratio between the primary clock input (CLKIN or PCI_CLK) and the internal coherent system bus clock (*csb_clk*). Table 59 and Table 60 show the expected frequency values for the CSB frequency for select *csb_clk* to CLKIN/PCI_SYNC_IN ratios.

Table 59. CSB Frequency Options for Host Mode

CFG_CLKIN_DIV at Reset[1]	SPMF	*csb_clk* : Input Clock Ratio[2]	Input Clock Frequency (MHz)[2]			
			16.67	25	33.33	66.67
			csb_clk Frequency (MHz)			
Low	0010	2 : 1				133
Low	0011	3 : 1			100	200
Low	0100	4 : 1		100	133	266
Low	0101	5 : 1		125	166	333

Table 60. CSB Frequency Options for Agent Mode (continued)

CFG_CLKIN_DIV at Reset[1]	SPMF	*csb_clk* : Input Clock Ratio[2]	Input Clock Frequency (MHz)[2]			
			16.67	25	33.33	66.67
			csb_clk Frequency (MHz)			
Low	0110	6 : 1	100	150	200	
Low	0111	7 : 1	116	175	233	
Low	1000	8 : 1	133	200	266	
Low	1001	9 : 1	150	225	300	
Low	1010	10 : 1	166	250	333	
Low	1011	11 : 1	183	275		
Low	1100	12 : 1	200	300		
Low	1101	13 : 1	216	325		
Low	1110	14 : 1	233			
Low	1111	15 : 1	250			
Low	0000	16 : 1	266			
High	0010	4 : 1		100	133	266
High	0011	6 : 1	100	150	200	
High	0100	8 : 1	133	200	266	
High	0101	10 : 1	166	250	333	
High	0110	12 : 1	200	300		
High	0111	14 : 1	233			
High	1000	16 : 1	266			

[1] CFG_CLKIN_DIV doubles csb_clk if set high.

[2] CLKIN is the input clock in host mode; PCI_CLK is the input clock in agent mode.

19.2 Core PLL Configuration

RCWL[COREPLL] selects the ratio between the internal coherent system bus clock (*csb_clk*) and the e300 core clock (*core_clk*). Table 61 shows the encodings for RCWL[COREPLL]. COREPLL values that are not listed in Table 61 should be considered as reserved.

NOTE

Core VCO frequency = core frequency × VCO divider

VCO divider must be set properly so that the core VCO frequency is in the range of 800–1800 MHz.

Table 63. Package Thermal Characteristics for TBGA (continued)

Characteristic	Symbol	Value	Unit	Notes
Junction-to-package natural convection on top	ψ_{JT}	1	°C/W	6

Notes:

1. Junction temperature is a function of die size, on-chip power dissipation, package thermal resistance, mounting site (board) temperature, ambient temperature, air flow, power dissipation of other components on the board, and board thermal resistance.
2. Per SEMI G38-87 and JEDEC JESD51-2 with the single-layer board horizontal.
3. Per JEDEC JESD51-6 with the board horizontal, 1 m/s is approximately equal to 200 linear feet per minute (LFM).
4. Thermal resistance between the die and the printed-circuit board per JEDEC JESD51-8. Board temperature is measured on the top surface of the board near the package.
5. Thermal resistance between the die and the case top surface as measured by the cold plate method (MIL SPEC-883 Method 1012.1).
6. Thermal characterization parameter indicating the temperature difference between package top and the junction temperature per JEDEC JESD51-2. When Greek letters are not available, the thermal characterization parameter is written as Psi-JT.

20.2 Thermal Management Information

For the following sections, $P_D = (V_{DD} \times I_{DD}) + P_{I/O}$ where $P_{I/O}$ is the power dissipation of the I/O drivers. See Table 5 for I/O power dissipation values.

20.2.1 Estimation of Junction Temperature with Junction-to-Ambient Thermal Resistance

An estimation of the chip junction temperature, T_J, can be obtained from the equation:

$$T_J = T_A + (R_{\theta JA} \times P_D)$$

where:

T_J = junction temperature (°C)
T_A = ambient temperature for the package (°C)
$R_{\theta JA}$ = junction-to-ambient thermal resistance (°C/W)
P_D = power dissipation in the package (W)

The junction-to-ambient thermal resistance is an industry-standard value that provides a quick and easy estimation of thermal performance. Generally, the value obtained on a single-layer board is appropriate for a tightly packed printed-circuit board. The value obtained on the board with the internal planes is usually appropriate if the board has low power dissipation and the components are well separated. Test cases have demonstrated that errors of a factor of two (in the quantity $T_J - T_A$) are possible.

20.2.2 Estimation of Junction Temperature with Junction-to-Board Thermal Resistance

The thermal performance of a device cannot be adequately predicted from the junction-to-ambient thermal resistance. The thermal performance of any component is strongly dependent on the power dissipation of surrounding components. In addition, the ambient temperature varies widely within the application. For many natural convection and especially closed box applications, the board temperature at the perimeter

Heat sink vendors include the following list:

Interface material vendors include the following:

Chomerics, Inc. 77 Dragon Ct. Woburn, MA 01801 Internet: www.chomerics.com	781-935-4850
Dow-Corning Corporation Dow-Corning Electronic Materials P.O. Box 994 Midland, MI 48686-0997 Internet: www.dowcorning.com	800-248-2481
Shin-Etsu MicroSi, Inc. 10028 S. 51st St. Phoenix, AZ 85044 Internet: www.microsi.com	888-642-7674

$V_2 = (1 \div (1/R_1 + 1/R_2)) \times I_{source}$. Solving for the output impedance gives $R_{source} = R_{term} \times (V_1 \div V_2 - 1)$. The drive current is then $I_{source} = V_1 \div R_{source}$.

Table 65 summarizes the signal impedance targets. The driver impedance are targeted at minimum V_{DD}, nominal OV_{DD}, 105°C.

Table 65. Impedance Characteristics

Impedance	Local Bus, Ethernet, DUART, Control, Configuration, Power Management	PCI Signals (Not Including PCI Output Clocks)	PCI Output Clocks (Including PCI_SYNC_OUT)	DDR DRAM	Symbol	Unit
R_N	42 Target	25 Target	42 Target	20 Target	Z_0	W
R_P	42 Target	25 Target	42 Target	20 Target	Z_0	W
Differential	NA	NA	NA	NA	Z_{DIFF}	W

Note: Nominal supply voltages. See Table 1, T_j = 105°C.

21.6 Configuration Pin Multiplexing

The MPC8349EA power-on configuration options can be set through external pull-up or pull-down resistors of 4.7 kΩ on certain output pins (see the customer-visible configuration pins). These pins are used as output only pins in normal operation.

However, while $\overline{\text{HRESET}}$ is asserted, these pins are treated as inputs, and the value on these pins is latched when $\overline{\text{PORESET}}$ deasserts. Then the input receiver is disabled and the I/O circuit takes on its normal function. Careful board layout with stubless connections to these pull-up/pull-down resistors coupled with the large value of the pull-up/pull-down resistor should minimize the disruption of signal quality or speed for the output pins.

21.7 Pull-Up Resistor Requirements

The MPC8349EA requires high resistance pull-up resistors (10 kΩ is recommended) on open-drain pins, including I^2C pins, and IPIC interrupt pins.

For more information on required pull-up resistors and the connections required for the JTAG interface, refer to application note AN2931, “PowerQUICC Design Checklist.”

22 Ordering Information

This section presents ordering information for the device discussed in this document, and it shows an example of how the parts are marked.

NOTE

The information in this document is accurate for revision 3.x silicon and later (in other words, for orderable part numbers ending in A or B). For information on revision 1.1 silicon and earlier versions, see the *MPC8349E PowerQUICC II Pro Integrated Host Processor Hardware Specifications* (Document Order No. MPC8349EEC).
