
Welcome to E-XFL.COM

Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

Details	
Product Status	Active
Core Processor	PowerPC e300
Number of Cores/Bus Width	1 Core, 32-Bit
Speed	533MHz
Co-Processors/DSP	Security; SEC
RAM Controllers	DDR, DDR2
Graphics Acceleration	No
Display & Interface Controllers	-
Ethernet	10/100/1000Mbps (2)
SATA	-
USB	USB 2.0 + PHY (2)
Voltage - I/O	1.8V, 2.5V, 3.3V
Operating Temperature	-40°C ~ 105°C (TA)
Security Features	Cryptography, Random Number Generator
Package / Case	672-LBGA
Supplier Device Package	672-LBGA (35x35)
Purchase URL	https://www.e-xfl.com/pro/item?MUrl=&PartUrl=mpc8349ecvvajdb

NOTE

The information in this document is accurate for revision 3.x silicon and later (in other words, for orderable part numbers ending in A or B). For information on revision 1.1 silicon and earlier versions, see the *MPC8349E PowerQUICC II Pro Integrated Host Processor Hardware Specifications.*

See Section 22.1, "Part Numbers Fully Addressed by This Document," for silicon revision level determination.

1 Overview

This section provides a high-level overview of the device features. Figure 1 shows the major functional units within the MPC8349EA.

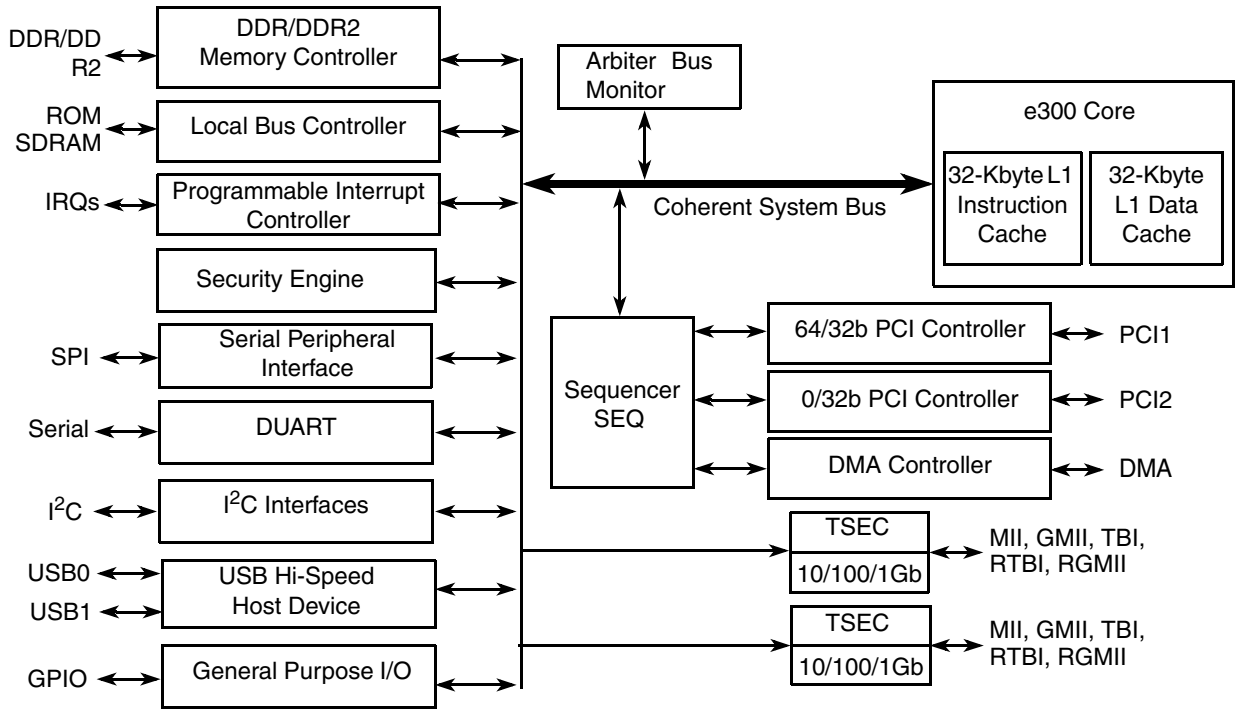

Figure 1. MPC8349EA Block Diagram

Major features of the device are as follows:

- Embedded PowerPC e300 processor core; operates at up to 667 MHz
  - High-performance, superscalar processor core
  - Floating-point, integer, load/store, system register, and branch processing units
  - 32-Kbyte instruction cache, 32-Kbyte data cache
  - Lockable portion of L1 cache
  - Dynamic power management
  - Software-compatible with the other Freescale processor families that implement Power Architecture technology

  - Complies with USB specification Rev. 2.0
  - Can operate as a stand-alone USB device
    - One upstream facing port
    - Six programmable USB endpoints
  - Can operate as a stand-alone USB host controller
    - USB root hub with one downstream-facing port
    - Enhanced host controller interface (EHCI) compatible
    - High-speed (480 Mbps), full-speed (12 Mbps), and low-speed (1.5 Mbps) operations
  - External PHY with UTMI, serial and UTMI+ low-pin interface (ULPI)
- Universal serial bus (USB) multi-port host controller
  - Can operate as a stand-alone USB host controller
    - USB root hub with one or two downstream-facing ports
    - Enhanced host controller interface (EHCI) compatible
    - Complies with *USB Specification Rev. 2.0*
  - High-speed (480 Mbps), full-speed (12 Mbps), and low-speed (1.5 Mbps) operations
  - Direct connection to a high-speed device without an external hub
  - External PHY with serial and low-pin count (ULPI) interfaces
- Local bus controller (LBC)
  - Multiplexed 32-bit address and data operating at up to 133 MHz
  - Eight chip selects for eight external slaves
  - Up to eight-beat burst transfers
  - 32-, 16-, and 8-bit port sizes controlled by an on-chip memory controller
  - Three protocol engines on a per chip select basis:
    - General-purpose chip select machine (GPCM)
    - Three user-programmable machines (UPMs)
    - Dedicated single data rate SDRAM controller
  - Parity support
  - Default boot ROM chip select with configurable bus width (8-, 16-, or 32-bit)
- Programmable interrupt controller (PIC)
  - Functional and programming compatibility with the MPC8260 interrupt controller
  - Support for 8 external and 35 internal discrete interrupt sources
  - Support for 1 external (optional) and 7 internal machine checkstop interrupt sources
  - Programmable highest priority request
  - Four groups of interrupts with programmable priority
  - External and internal interrupts directed to host processor
  - Redirects interrupts to external $\overline{\text{INTA}}$ pin in core disable mode.
  - Unique vector number for each interrupt source

- Dual industry-standard I^2C interfaces
  - Two-wire interface
  - Multiple master support
  - Master or slave I^2C mode support
  - On-chip digital filtering rejects spikes on the bus
  - System initialization data optionally loaded from I^2C-1 EPROM by boot sequencer embedded hardware
- DMA controller
  - Four independent virtual channels
  - Concurrent execution across multiple channels with programmable bandwidth control
  - Handshaking (external control) signals for all channels: $\overline{\text{DMA\_DREQ}}$[0:3], $\overline{\text{DMA\_DACK}}$[0:3], $\overline{\text{DMA\_DDONE}}$[0:3]
  - All channels accessible to local core and remote PCI masters
  - Misaligned transfer capability
  - Data chaining and direct mode
  - Interrupt on completed segment and chain
- DUART
  - Two 4-wire interfaces (RxD, TxD, RTS, CTS)
  - Programming model compatible with the original 16450 UART and the PC16550D
- Serial peripheral interface (SPI) for master or slave
- General-purpose parallel I/O (GPIO)
  - 64 parallel I/O pins multiplexed on various chip interfaces
- System timers
  - Periodic interrupt timer
  - Real-time clock
  - Software watchdog timer
  - Eight general-purpose timers
- Designed to comply with IEEE Std. 1149.1™, JTAG boundary scan
- Integrated PCI bus and SDRAM clock generation

2 Electrical Characteristics

This section provides the AC and DC electrical specifications and thermal characteristics for the MPC8349EA. The device is currently targeted to these specifications. Some of these specifications are independent of the I/O cell, but are included for a more complete reference. These are not purely I/O buffer design specifications.

2.1 Overall DC Electrical Characteristics

This section covers the ratings, conditions, and other characteristics.

2.1.2 Power Supply Voltage Specification

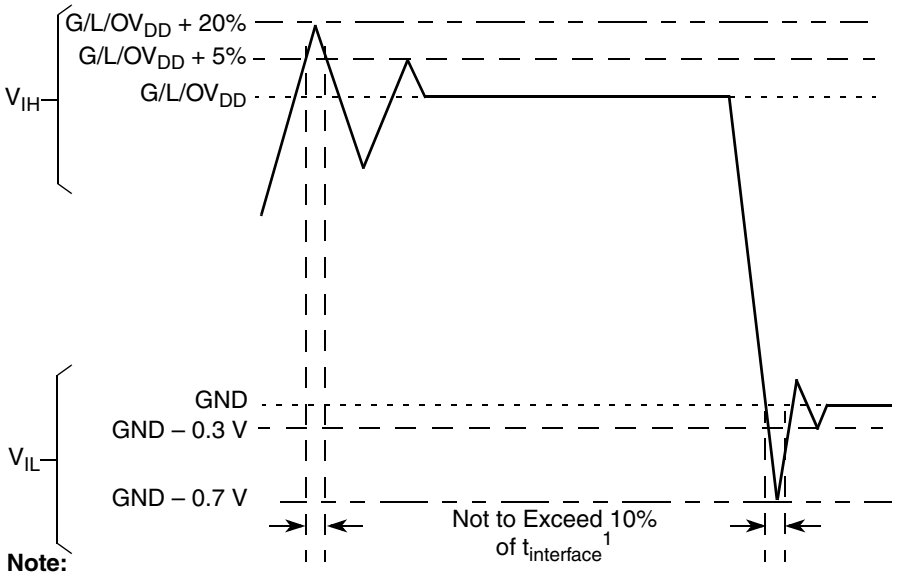
Table 2 provides the recommended operating conditions for the MPC8349EA. Note that the values in Table 2 are the recommended and tested operating conditions. Proper device operation outside these conditions is not guaranteed.

Table 2. Recommended Operating Conditions

Parameter	Symbol	Recommended Value	Unit	Notes
Core supply voltage for 667-MHz core frequency	V_{DD}	1.3 V ± 60 mV	V	1
Core supply voltage	V_{DD}	1.2 V ± 60 mV	V	1
PLL supply voltage for 667-MHz core frequency	AV_{DD}	1.3 V ± 60 mV	V	1
PLL supply voltage	AV_{DD}	1.2 V ± 60 mV	V	1
DDR and DDR2 DRAM I/O voltage	GV_{DD}	2.5 V ± 125 mV 1.8 V ± 90 mV	V	—
Three-speed Ethernet I/O supply voltage	LV_{DD1}	3.3 V ± 330 mV 2.5 V ± 125 mV	V	—
Three-speed Ethernet I/O supply voltage	LV_{DD2}	3.3 V ± 330 mV 2.5 V ± 125 mV	V	—
PCI, local bus, DUART, system control and power management, I^2C, and JTAG I/O voltage	OV_{DD}	3.3 V ± 330 mV	V	—

Note:
1 GV_{DD}, LV_{DD}, OV_{DD}, AV_{DD}, and V_{DD} must track each other and must vary in the same direction—either in the positive or negative direction.

Figure 2 shows the undershoot and overshoot voltages at the interfaces of the MPC8349EA.



Note:
1. $t_{interface}$ refers to the clock period associated with the bus clock interface.

Figure 2. Overshoot/Undershoot Voltage for $GV_{DD}/OV_{DD}/LV_{DD}$

6.2.2 DDR and DDR2 SDRAM Output AC Timing Specifications

Table 20 shows the DDR and DDR2 output AC timing specifications.

Table 20. DDR and DDR2 SDRAM Output AC Timing Specifications

At recommended operating conditions with GV_{DD} of (1.8 or 2.5 V) ± 5%.

Parameter	Symbol [1]	Min	Max	Unit	Notes
ADDR/CMD/MODT output setup with respect to MCK	t_{DDKHAS}			ns	3

Table 27. MII Transmit AC Timing Specifications (continued)

At recommended operating conditions with LV_{DD}/OV_{DD} of 3.3 V ± 10%.

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit
TX_CLK data clock rise (20%–80%)	t_{MTXR}	1.0	—	4.0	ns
TX_CLK data clock fall (80%–20%)	t_{MTXF}	1.0	—	4.0	ns

Note:

1. The symbols for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{MTKHDX} symbolizes MII transmit timing (MT) for the time t_{MTX} clock reference (K) going high (H) until data outputs (D) are invalid (X). In general, the clock reference symbol is based on two to three letters representing the clock of a particular function. For example, the subscript of t_{MTX} represents the MII(M) transmit (TX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).

Figure 11 shows the MII transmit AC timing diagram.

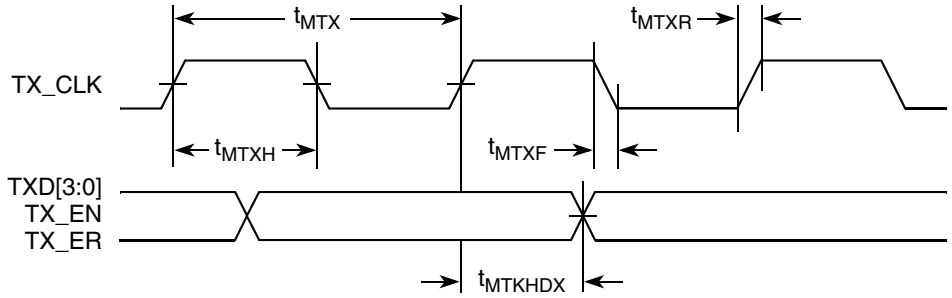

Figure 11. MII Transmit AC Timing Diagram

8.2.2.2 MII Receive AC Timing Specifications

Table 28 provides the MII receive AC timing specifications.

Table 28. MII Receive AC Timing Specifications

At recommended operating conditions with LV_{DD}/OV_{DD} of 3.3 V ± 10%.

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit
RX_CLK clock period 10 Mbps	t_{MRX}	—	400	—	ns
RX_CLK clock period 100 Mbps	t_{MRX}	—	40	—	ns
RX_CLK duty cycle	t_{MRXH}/t_{MRX}	35	—	65	%
RXD[3:0], RX_DV, RX_ER setup time to RX_CLK	t_{MRDVKH}	10.0	—	—	ns
RXD[3:0], RX_DV, RX_ER hold time to RX_CLK	t_{MRDXKH}	10.0	—	—	ns

Table 30. TBI Receive AC Timing Specifications (continued)

At recommended operating conditions with LV_{DD}/OV_{DD} of 3.3 V ± 10%.

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit
RXD[7:0], RX_DV, RX_ER (RCG[9:0]) setup time to rising PMA_RX_CLK	t_{TRDVKH}[2]	2.5	—	—	ns
RXD[7:0], RX_DV, RX_ER (RCG[9:0]) hold time to rising PMA_RX_CLK	t_{TRDXKH}[2]	1.5	—	—	ns
RX_CLK clock rise time (20%–80%)	t_{TRXR}	0.7	—	2.4	ns
RX_CLK clock fall time (80%–20%)	t_{TRXF}	0.7	—	2.4	ns

Notes:

1. The symbols for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{TRDVKH} symbolizes TBI receive timing (TR) with respect to the time data input signals (D) reach the valid state (V) relative to the t_{TRX} clock reference (K) going to the high (H) state or setup time. Also, t_{TRDXKH} symbolizes TBI receive timing (TR) with respect to the time data input signals (D) went invalid (X) relative to the t_{TRX} clock reference (K) going to the high (H) state. In general, the clock reference symbol is based on three letters representing the clock of a particular function. For example, the subscript of t_{TRX} represents the TBI (T) receive (RX) clock. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall). For symbols representing skews, the subscript SK followed by the clock that is being skewed (TRX).
2. Setup and hold time of even numbered RCG are measured from the riding edge of PMA_RX_CLK1. Setup and hold times of odd-numbered RCG are measured from the riding edge of PMA_RX_CLK0.

Figure 15 shows the TBI receive AC timing diagram.

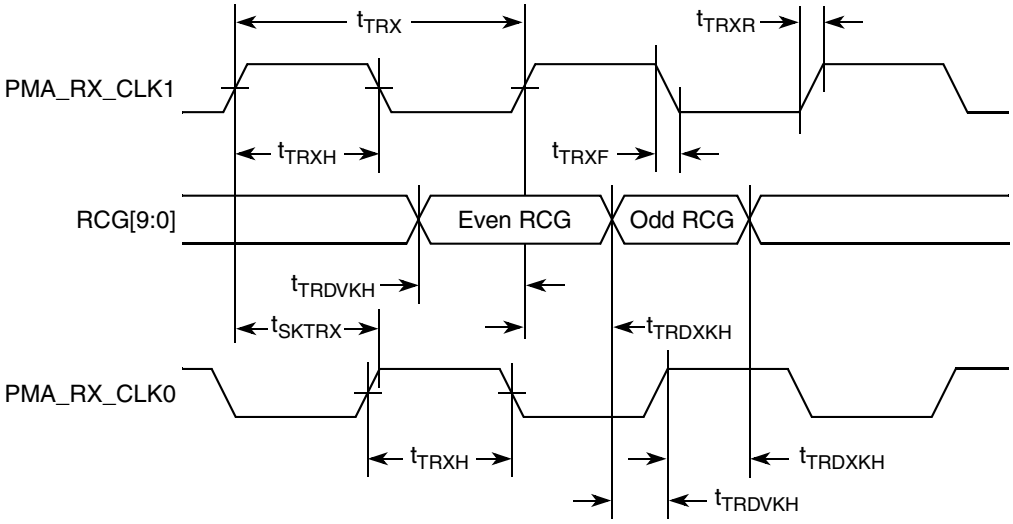

Figure 15. TBI Receive AC Timing Diagram

8.2.4 RGMII and RTBI AC Timing Specifications

Table 31 presents the RGMII and RTBI AC timing specifications.

Table 31. RGMII and RTBI AC Timing Specifications

At recommended operating conditions with LV_{DD} of 2.5 V ± 5%.

Parameter/Condition	Symbol[1]	Min	Typ	Max	Unit
Data to clock output skew (at transmitter)	t_{SKRGT}	–0.5	—	0.5	ns
Data to clock input skew (at receiver)[2]	t_{SKRGT}	1.0	—	2.8	ns
Clock cycle duration[3]	t_{RGT}	7.2	8.0	8.8	ns
Duty cycle for 1000Base-T[4, 5]	t_{RGTH}/t_{RGT}	45	50	55	%
Duty cycle for 10BASE-T and 100BASE-TX[3, 5]	t_{RGTH}/t_{RGT}	40	50	60	%
Rise time (20%–80%)	t_{RGTR}	—	—	0.75	ns
Fall time (80%–20%)	t_{RGTF}	—	—	0.75	ns

Notes:

1. In general, the clock reference symbol for this section is based on the symbols RGT to represent RGMII and RTBI timing. For example, the subscript of t_{RGT} represents the TBI (T) receive (RX) clock. Also, the notation for rise (R) and fall (F) times follows the clock symbol. For symbols representing skews, the subscript is SK followed by the clock being skewed (RGT).
2. This implies that PC board design requires clocks to be routed so that an additional trace delay of greater than 1.5 ns is added to the associated clock signal.
3. For 10 and 100 Mbps, t_{RGT} scales to 400 ns ± 40 ns and 40 ns ± 4 ns, respectively.
4. Duty cycle may be stretched/shrunk during speed changes or while transitioning to a received packet clock domains as long as the minimum duty cycle is not violated and stretching occurs for no more than three t_{RGT} of the lowest speed transitioned.
5. Duty cycle reference is $LV_{DD}/2$.

Table 41. JTAG AC Timing Specifications (Independent of CLKIN)[1] (continued)

At recommended operating conditions (see Table 2).

Parameter	Symbol[2]	Min	Max	Unit	Notes
JTAG external clock to output high impedance: Boundary-scan data TDO	 t_{JTKLDZ} t_{JTKLOZ}	 2 2	 19 9	ns	5, 6

Notes:

1. All outputs are measured from the midpoint voltage of the falling/rising edge of t_{TCLK} to the midpoint of the signal in question. The output timings are measured at the pins. All output timings assume a purely resistive 50 Ω load (see Figure 18). Time-of-flight delays must be added for trace lengths, vias, and connectors in the system.
2. The symbols for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{JTDVKH} symbolizes JTAG device timing (JT) with respect to the time data input signals (D) reaching the valid state (V) relative to the t_{JTG} clock reference (K) going to the high (H) state or setup time. Also, t_{JTDXKH} symbolizes JTAG timing (JT) with respect to the time data input signals (D) went invalid (X) relative to the t_{JTG} clock reference (K) going to the high (H) state. In general, the clock reference symbol is based on three letters representing the clock of a particular function. For rise and fall times, the latter convention is used with the appropriate letter: R (rise) or F (fall).
3. $\overline{\text{TRST}}$ is an asynchronous level sensitive signal. The setup time is for test purposes only.
4. Non-JTAG signal input timing with respect to t_{TCLK}.
5. Non-JTAG signal output timing with respect to t_{TCLK}.
6. Guaranteed by design and characterization.

Figure 27 provides the AC test load for TDO and the boundary-scan outputs of the MPC8349EA.

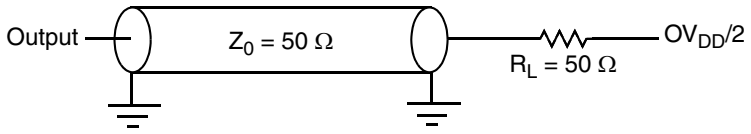

Figure 27. AC Test Load for the JTAG Interface

Figure 28 provides the JTAG clock input timing diagram.

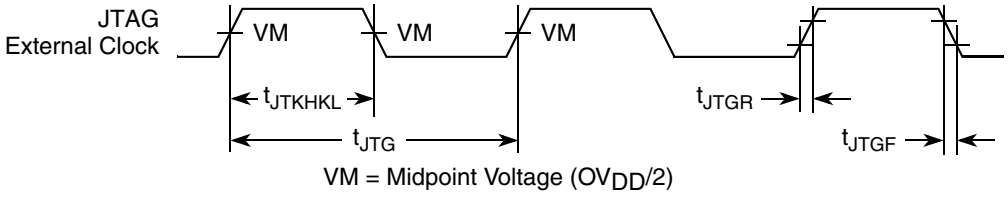

Figure 28. JTAG Clock Input Timing Diagram

Figure 29 provides the $\overline{\text{TRST}}$ timing diagram.

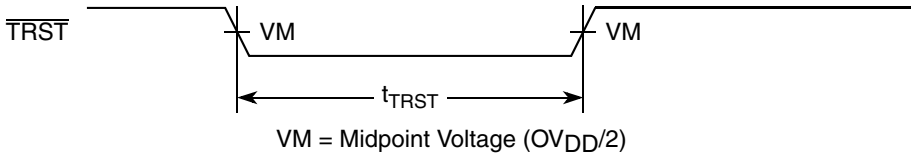

Figure 29. $\overline{\text{TRST}}$ Timing Diagram

13 PCI

This section describes the DC and AC electrical specifications for the PCI bus of the MPC8349EA.

13.1 PCI DC Electrical Characteristics

Table 44 provides the DC electrical characteristics for the PCI interface of the MPC8349EA.

Table 44. PCI DC Electrical Characteristics

Parameter	Symbol	Test Condition	Min	Max	Unit
High-level input voltage	V_{IH}	$V_{OUT} \geq V_{OH}$ (min) or	2	OV_{DD} + 0.3	V
Low-level input voltage	V_{IL}	$V_{OUT} \leq V_{OL}$ (max)	–0.3	0.8	V
Input current	I_{IN}	V_{IN}[1]= 0 V or $V_{IN} = OV_{DD}$	—	±5	μA
High-level output voltage	V_{OH}	OV_{DD} = min, I_{OH} = –100 μA	OV_{DD} – 0.2	—	V
Low-level output voltage	V_{OL}	OV_{DD} = min, I_{OL} = 100 μA	—	0.2	V

Note:
1. The symbol V_{IN}, in this case, represents the OV_{IN} symbol referenced in Table 1.

13.2 PCI AC Electrical Specifications

This section describes the general AC timing parameters of the PCI bus of the MPC8349EA. Note that the PCI_CLK or PCI_SYNC_IN signal is used as the PCI input clock depending on whether the device is configured as a host or agent device. Table 45 provides the PCI AC timing specifications at 66 MHz.

Table 45. PCI AC Timing Specifications at 66 MHz[1]

Parameter	Symbol[2]	Min	Max	Unit	Notes
Clock to output valid	t_{PCKHOV}	—	6.0	ns	3
Output hold from clock	t_{PCKHOX}	1	—	ns	3
Clock to output high impedance	t_{PCKHOZ}	—	14	ns	3, 4
Input setup to clock	t_{PCIVKH}	3.0	—	ns	3, 5
Input hold from clock	t_{PCIXKH}	0	—	ns	3, 5
$\overline{\text{REQ64}}$ to $\overline{\text{PORESET}}$ setup time	t_{PCRVRH}	5	—	clocks	6

Table 45. PCI AC Timing Specifications at 66 MHz[1] (continued)

Parameter	Symbol[2]	Min	Max	Unit	Notes
$\overline{\text{PORESET}}$ to $\overline{\text{REQ64}}$ hold time	t_{PCRHRX}	0	50	ns	6

Notes:
1. PCI timing depends on M66EN and the ratio between PCI1/PCI2. Refer to the PCI chapter of the reference manual for a description of M66EN.
2. The symbols for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{PCIVKH} symbolizes PCI timing (PC) with respect to the time the input signals (I) reach the valid state (V) relative to the PCI_SYNC_IN clock, t_{SYS}, reference (K) going to the high (H) state or setup time. Also, t_{PCRHFV} symbolizes PCI timing (PC) with respect to the time hard reset (R) went high (H) relative to the frame signal (F) going to the valid (V) state.
3. See the timing measurement conditions in the *PCI 2.3 Local Bus Specifications*.
4. For active/float timing measurements, the Hi-Z or off-state is defined to be when the total current delivered through the component pin is less than or equal to the leakage current specification.
5. Input timings are measured at the pin.
6. The setup and hold time is with respect to the rising edge of $\overline{\text{PORESET}}$.

Table 46 provides the PCI AC timing specifications at 33 MHz.

Table 46. PCI AC Timing Specifications at 33 MHz

Parameter	Symbol[1]	Min	Max	Unit	Notes
Clock to output valid	t_{PCKHOV}	—	11	ns	2
Output hold from clock	t_{PCKHOX}	2	—	ns	2
Clock to output high impedance	t_{PCKHOZ}	—	14	ns	2, 3
Input setup to clock	t_{PCIVKH}	3.0	—	ns	2, 4
Input hold from clock	t_{PCIXKH}	0	—	ns	2, 4
$\overline{\text{REQ64}}$ to $\overline{\text{PORESET}}$ setup time	t_{PCRVRH}	5	—	clocks	5
$\overline{\text{PORESET}}$ to $\overline{\text{REQ64}}$ hold time	t_{PCRHRX}	0	50	ns	5

Notes:
1. The symbols for timing specifications follow the pattern of $t_{\text{(first two letters of functional block)(signal)(state)(reference)(state)}}$ for inputs and $t_{\text{(first two letters of functional block)(reference)(state)(signal)(state)}}$ for outputs. For example, t_{PCIVKH} symbolizes PCI timing (PC) with respect to the time the input signals (I) reach the valid state (V) relative to the PCI_SYNC_IN clock, t_{SYS}, reference (K) going to the high (H) state or setup time. Also, t_{PCRHFV} symbolizes PCI timing (PC) with respect to the time hard reset (R) went high (H) relative to the frame signal (F) going to the valid (V) state.
2. See the timing measurement conditions in the *PCI 2.3 Local Bus Specifications*.
3. For active/float timing measurements, the Hi-Z or off-state is defined to be when the total current delivered through the component pin is less than or equal to the leakage current specification.
4. Input timings are measured at the pin.
5. The setup and hold time is with respect to the rising edge of $\overline{\text{PORESET}}$.

Figure 37 provides the AC test load for the SPI.

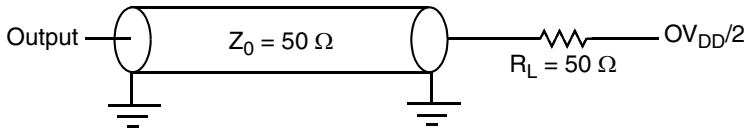

Figure 37. SPI AC Test Load

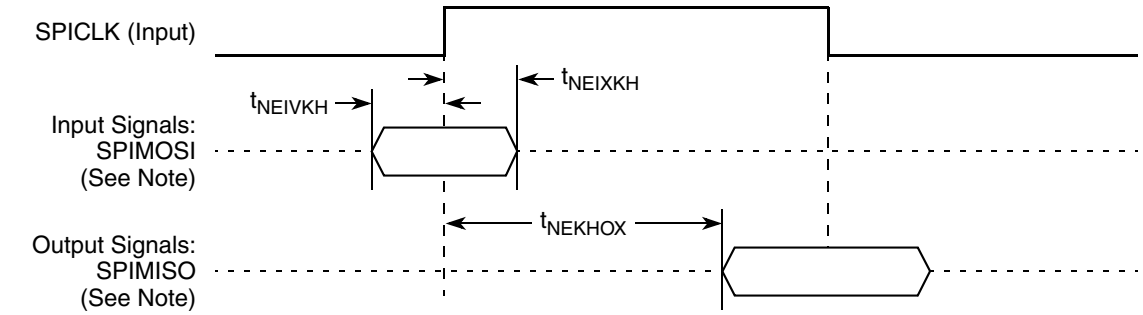
Figure 38 and Figure 39 represent the AC timings from Table 54. Note that although the specifications generally reference the rising edge of the clock, these AC timing diagrams also apply when the falling edge is the active edge.

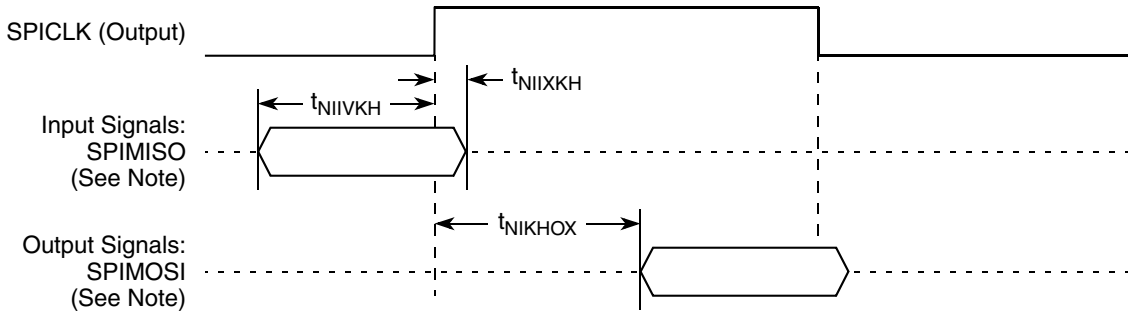
Figure 38 shows the SPI timings in slave mode (external clock).



Note: The clock edge is selectable on SPI.

Figure 38. SPI AC Timing in Slave Mode (External Clock) Diagram

Figure 39 shows the SPI timings in master mode (internal clock).



Note: The clock edge is selectable on SPI.

Figure 39. SPI AC Timing in Master Mode (Internal Clock) Diagram

18 Package and Pin Listings

This section details package parameters, pin assignments, and dimensions. The MPC8349EA is available in a tape ball grid array (TBGA). See Section 18.1, “Package Parameters for the MPC8349EA TBGA” and Section 18.2, “Mechanical Dimensions for the MPC8349EA TBGA.

Table 55. MPC8349EA (TBGA) Pinout Listing (continued)

Signal	Package Pin Number	Pin Type	Power Supply	Notes
MVREF2	AD2	I	DDR reference voltage	—

Notes:
1. This pin is an open-drain signal. A weak pull-up resistor (1 kΩ) should be placed on this pin to OV_{DD}.
2. This pin is an open-drain signal. A weak pull-up resistor (2–10 kΩ) should be placed on this pin to OV_{DD}.
3. During reset, this output is actively driven rather than three-stated.
4. These JTAG pins have weak internal pull-up P-FETs that are always enabled.
5. This pin should have a weak pull-up if the chip is in PCI host mode. Follow the PCI specifications.
6. This pin must always be tied to GND.
7. This pin must always be left not connected.
8. Thermal sensitive resistor.
9. It is recommended that MDIC0 be tied to GND using an 18.2 Ω resistor and MDIC1 be tied to DDR power using an 18.2 Ω resistor.
10. TSEC1_TXD[3] is required an external pull-up resistor. For proper functionality of the device, this pin must be pulled up or actively driven high during a hard reset. No external pull-down resistors are allowed to be attached to this net.
11. A weak pull-up resistor (2–10 kΩ) should be placed on this pin to LV_{DD1}.
12. For systems that boot from local bus (GPCM)-controlled NOR flash, a pullup on LGPL4 is required.

11	**0011**	0	3:1	8

[1] Core VCO frequency = core frequency × VCO divider. The VCO divider must be set properly so that the core VCO frequency is in the range of 800–1800 MHz.

Heat sink vendors include the following list:

Aavid Thermalloy 603-224-9988
80 Commercial St.
Concord, NH 03301
Internet: www.aavidthermalloy.com

Alpha Novatech 408-567-8082
473 Sapena Ct. #12
Santa Clara, CA 95054
Internet: www.alphanovatech.com

International Electronic Research Corporation (IERC) 818-842-7277
413 North Moss St.
Burbank, CA 91502
Internet: www.ctscorp.com

Millennium Electronics (MEI) 408-436-8770
Loroco Sites
671 East Brokaw Road
San Jose, CA 95112
Internet: www.mei-thermal.com

Tyco Electronics 800-522-2800
Chip Coolers™
P.O. Box 3668
Harrisburg, PA 17105-3668
Internet: www.chipcoolers.com

Wakefield Engineering 603-635-5102
33 Bridge St.
Pelham, NH 03076
Internet: www.wakefield.com

Interface material vendors include the following:

Chomerics, Inc. 781-935-4850
77 Dragon Ct.
Woburn, MA 01801
Internet: www.chomerics.com

Dow-Corning Corporation 800-248-2481
Dow-Corning Electronic Materials
P.O. Box 994
Midland, MI 48686-0997
Internet: www.dowcorning.com

Shin-Etsu MicroSi, Inc. 888-642-7674
10028 S. 51st St.
Phoenix, AZ 85044
Internet: www.microsi.com

The Bergquist Company 800-347-4572
18930 West 78th St.
Chanhassen, MN 55317
Internet: www.bergquistcompany.com

20.3 Heat Sink Attachment

When heat sinks are attached, an interface material is required, preferably thermal grease and a spring clip. The spring clip should connect to the printed-circuit board, either to the board itself, to hooks soldered to the board, or to a plastic stiffener. Avoid attachment forces that can lift the edge of the package or peel the package from the board. Such peeling forces reduce the solder joint lifetime of the package. The recommended maximum force on the top of the package is 10 lb force (4.5 kg force). Any adhesive attachment should attach to painted or plastic surfaces, and its performance should be verified under the application requirements.

20.3.1 Experimental Determination of the Junction Temperature with a Heat Sink

When a heat sink is used, the junction temperature is determined from a thermocouple inserted at the interface between the case of the package and the interface material. A clearance slot or hole is normally required in the heat sink. Minimize the size of the clearance to minimize the change in thermal performance caused by removing part of the thermal interface to the heat sink. Because of the experimental difficulties with this technique, many engineers measure the heat sink temperature and then back calculate the case temperature using a separate measurement of the thermal resistance of the interface. From this case temperature, the junction temperature is determined from the junction-to-case thermal resistance.

$$T_J = T_C + (R_{\theta JC} \times P_D)$$

where:

T_J = junction temperature (°C)
T_C = case temperature of the package (°C)
$R_{\theta JC}$ = junction-to-case thermal resistance (°C/W)
P_D = power dissipation (W)

21 System Design Information

This section provides electrical and thermal design recommendations for successful application of the MPC8349EA.

21.1 System Clocking

The MPC8349EA includes two PLLs:

1. The platform PLL generates the platform clock from the externally supplied CLKIN input. The frequency ratio between the platform and CLKIN is selected using the platform PLL ratio configuration bits as described in Section 19.1, “System PLL Configuration.”

Table 68. Document Revision History (continued)

Rev. Number	Date	Substantive Change(s)
3	11/2006	• Updated note in introduction. • In the features list in Section 1, “Overview,” updated DDR data rate to show 400 MHz for DDR2 for TBGA parts for silicon 3.x and 400 MHz for DDR2 for TBGA parts for silicon 3.x. • In Section 23, “Ordering Information,” replicated note from document introduction.
2	8/2006	• Changed all references to revision 2.0 silicon to revision 3.0 silicon. • Changed VIH minimum value in Table 40, “JTAG Interface DC Electrical Characteristics,” to OV_{DD} – 0.3. • In Table 44, “PCI DC Electrical Characteristics,” changed high-level input voltage values to min = 2 and max = OV_{DD} + 0.3; changed low-level input voltage values to min = (–0.3) and max = 0.8. • Updated DDR2 I/O power values in Table 5, “MPC8347EA Typical I/O Power Dissipation.” • In Table 66, “Suggested PLL Configurations,” deleted reference-number rows 902 and 703.
1	4/2006	• Removed Table 20, “Timing Parameters for DDR2-400.” • Changed ADDR/CMD to ADDR/CMD/MODT in Table 9, “DDR and DDR2 SDRAM Output AC Timing Specifications,” rows 2 and 3, and in Figure 2, “DDR SDRAM Output Timing Diagram. • Changed Min and Max values for V_{IH} and VIL in Table 40Table 44,“PCI DC Electrical Characteristics.” • In Table 55, “MPC8349EA (TBGA) Pinout Listing,” and Table 52, “MPC8347EA (PBGA) Pinout Listing,” modified rows for MDICO and MDIC1 signals and added note ‘It is recommended that MDICO be tied to GRD using an 18 Ω resistor and MCIC1 be tied to DDR power using an 18 Ω resistor.’ • Table 55, “MPC8349EA (TBGA) Pinout Listing,” in row AVDD3 changed power supply from “AVDD3” to ‘—.’
