### Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### Details

Product Status	Obsolete
Number of LABs/CLBs	196
Number of Logic Elements/Cells	466
Total RAM Bits	6272
Number of I/O	112
Number of Gates	5000
Voltage - Supply	3V ~ 3.6V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	144-LQFP
Supplier Device Package	144-TQFP (20x20)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/xilinx/xc4005xl-09tq144c">https://www.e-xfl.com/product-detail/xilinx/xc4005xl-09tq144c</a>

### XC4000XL Electrical Specifications

#### Definition of Terms

In the following tables, some specifications may be designated as Advance or Preliminary. These terms are defined as follows:

**Advance:** Initial estimates based on simulation and/or extrapolation from other speed grades, devices, or device families. Values are subject to change. Use as estimates, not for production.

**Preliminary:** Based on preliminary characterization. Further changes are not expected.

**Unmarked:** Specifications not identified as either Advance or Preliminary are to be considered Final.

Except for pin-to-pin input and output parameters, the a.c. parameter delay specifications included in this document are derived from measuring internal test patterns. All specifications are representative of worst-case supply voltage and junction temperature conditions.

**All specifications subject to change without notice.**

### XC4000XL D.C. Characteristics

#### Absolute Maximum Ratings

	Description		Units
$V_{CC}$	Supply voltage relative to Ground	-0.5 to 4.0	V
$V_{IN}$	Input voltage relative to Ground (Note 1)	-0.5 to 5.5	V
$V_{TS}$	Voltage applied to 3-state output (Note 1)	-0.5 to 5.5	V
$V_{CCt}$	Longest Supply Voltage Rise Time from 1 V to 3V	50	ms
$T_{STG}$	Storage temperature (ambient)	-65 to +150	°C
$T_{SOL}$	Maximum soldering temperature (10 s @ 1/16 in. = 1.5 mm)	+260	°C
$T_J$	Junction Temperature	Ceramic packages	+150
		Plastic packages	+125

Note 1: Maximum DC excursion above  $V_{CC}$  or below Ground must be limited to either 0.5 V or 10 mA, whichever is easier to achieve. During transitions, the device pins may undershoot to -2.0 V or overshoot to  $V_{CC} + 2.0$  V, provided this over or undershoot lasts less than 10 ns and with the forcing current being limited to 200 mA.

Note: Stresses beyond those listed under Absolute Maximum Ratings may cause permanent damage to the device. These are stress ratings only, and functional operation of the device at these or any other conditions beyond those listed under Recommended Operating Conditions is not implied. Exposure to Absolute Maximum Ratings conditions for extended periods of time may affect device reliability.

#### Recommended Operating Conditions

Symbol	Description		Min	Max	Units
V <sub>CC</sub>	Supply voltage relative to Gnd, T <sub>J</sub> = 0 °C to +85°C	Commercial	3.0	3.6	V
	Supply voltage relative to Gnd, T <sub>J</sub> = -40°C to +100°C	Industrial	3.0	3.6	V
V <sub>IH</sub>	High-level input voltage		50% of V <sub>CC</sub>	5.5	V
V <sub>IL</sub>	Low-level input voltage		0	30% of V <sub>CC</sub>	V
T <sub>IN</sub>	Input signal transition time			250	ns

Notes: At junction temperatures above those listed above, all delay parameters increase by 0.35% per °C. Input and output measurement threshold is ~50% of  $V_{CC}$ .

## D.C. Characteristics Over Recommended Operating Conditions

Symbol	Description	Min	Max	Units
$V_{OH}$	High-level output voltage @ $I_{OH} = -4.0$ mA, $V_{CC}$ min (LVTTL)	2.4		V
	High-level output voltage @ $I_{OH} = -500$ $\mu$ A, (LVCMOS)	90% $V_{CC}$		V
$V_{OL}$	Low-level output voltage @ $I_{OL} = 12.0$ mA, $V_{CC}$ min (LVTTL) (Note 1)		0.4	V
	Low-level output voltage @ $I_{OL} = 1500$ $\mu$ A, (LVCMOS)		10% $V_{CC}$	V
$V_{DR}$	Data Retention Supply Voltage (below which configuration data may be lost)	2.5		V
$I_{CCO}$	Quiescent FPGA supply current (Note 2)		5	mA
$I_L$	Input or output leakage current	-10	+10	$\mu$ A
$C_{IN}$	Input capacitance (sample tested)	BGA, SBGA, PQ, HQ, MQ packages	10	pF
		PGA packages	16	pF
$I_{RPU}$	Pad pull-up (when selected) @ $V_{in} = 0$ V (sample tested)	0.02	0.25	mA
$I_{RPD}$	Pad pull-down (when selected) @ $V_{in} = 3.6$ V (sample tested)	0.02	0.15	mA
$I_{RLL}$	Horizontal Longline pull-up (when selected) @ logic Low	0.3	2.0	mA

Note 1: With up to 64 pins simultaneously sinking 12 mA.

Note 2: With no output current loads, no active input or Longline pull-up resistors, all I/O pins Tri-stated and floating.

## Power-On Power Supply Requirements

Xilinx FPGAs require a minimum rated power supply current capacity to insure proper initialization, and the power supply ramp-up time does affect the current required. A fast ramp-up time requires more current than a slow ramp-up time. The slowest ramp-up time is 50 ms. Current capacity is not specified for a ramp-up time faster than 2ms. The current capacity varies lineally with ramp-up time, *e.g.*, an XC4036XL with a ramp-up time of 25 ms would require a capacity predicted by the point on the straight line drawn from 1A at 120  $\mu$ s to 500 mA at 50 ms at the 25 ms time mark. This point is approximately 750 mA .

Product	Description	Ramp-up Time	
		Fast (120 $\mu$ s)	Slow (50 ms)
XC4005 - 36XL	Minimum required current supply	1 A	500 mA
XC4044- 62XL	Minimum required current supply	2 A	500 mA
XC4085XL <sup>1</sup>	Minimum required current supply	2 A <sup>1</sup>	500 mA

Notes: 1. The XC4085XL fast ramp-up time is 5 ms.

Devices are guaranteed to initialize properly with the minimum current listed above. A larger capacity power supply may result in a larger initialization current.

This specification applies to Commercial and Industrial grade products only.

Ramp-up Time is measured from 0  $V_{DC}$  to 3.6  $V_{DC}$ . Peak current required lasts less than 3 ms, and occurs near the internal power on reset threshold voltage. After initialization and before configuration,  $I_{CCmax}$  is less than 10 mA.

### XC4000XL A.C. Characteristics

Testing of the switching parameters is modeled after testing methods specified by MIL-M-38510/605. All devices are 100% functionally tested. Internal timing parameters are derived from measuring internal test patterns. Listed below are representative values where one global clock input drives one vertical clock line in each accessible column, and where all accessible IOB and CLB flip-flops are clocked by the global clock net.

When fewer vertical clock lines are connected, the clock distribution is faster; when multiple clock lines per column are driven from the same global clock, the delay is longer. For more specific, more precise, and worst-case guaranteed data, reflecting the actual routing structure, use the values provided by the static timing analyzer (TRCE in the Xilinx Development System) and back-annotated to the simulation netlist. These path delays, provided as a guideline, have been extracted from the static timing analyzer report. All timing parameters assume worst-case operating conditions (supply voltage and junction temperature). Values apply to all XC4000XL devices and are expressed in nanoseconds unless otherwise noted.

#### Global Low Skew Buffer to Clock K

Notes: Clock-to-out minimum delay is measured with the fastest route and the lightest load, Clock-to-out maximum delay is measured using the farthest distance and a reference load of one clock pin (IK or OK) per IOB as well as driving all accessible CLB flip-flops. For designs with a smaller number of clock loads, the pad-to-IOB clock pin delay as determined by the static timing analyzer (TRCE) can be added to the AC parameter Tokpof and used as a worst-case pin-to-pin clock-to-out delay for clocked outputs for FAST mode configurations.

Output timing is measured at ~50% V<sub>CC</sub> threshold with 50 pF external capacitive load. For different loads, see Figure 1.

### Capacitive Load Factor

Figure 1 shows the relationship between I/O output delay and load capacitance. It allows a user to adjust the specified output delay if the load capacitance is different than 50 pF. For example, if the actual load capacitance is 120 pF, add 2.5 ns to the specified delay. If the load capacitance is 20 pF, subtract 0.8 ns from the specified output delay.

Figure 1 is usable over the specified operating conditions of voltage and temperature and is independent of the output slew rate control.

Figure 1: Delay Factor at Various Capacitive Loads

For designs with a smaller number of clock loads, the pad-to-IOB clock pin delay as determined by the static timing analyzer (TRCE) can be added to the AC parameter Tokpof and used as a worst-case pin-to-pin clock-to-out delay for clocked outputs for FAST mode configurations.

Output timing is measured at ~50% V<sub>CC</sub> threshold with 50 pF external capacitive load. For different loads, see Figure 1.

## XC4000XL Pin-to-Pin Input Parameter Guidelines

Testing of switching parameters is modeled after testing methods specified by MIL-M-38510/605. All devices are 100% functionally tested. Pin-to-pin timing parameters are derived from measuring external and internal test patterns and are guaranteed over worst-case operating conditions (supply voltage and junction temperature). Listed below are representative values for typical pin locations and normal clock loading. For more specific, more precise, and worst-case guaranteed data, reflecting the actual routing structure, use the values provided by the static timing analyzer (TRCE in the Xilinx Development System) and back-annotated to the simulation netlist. These path delays, provided as a guideline, have been extracted from the static timing analyzer report. Values are expressed in nanoseconds unless otherwise noted

IFF = Input Flip-Flop or Latch, FCL = Fast Capture Latch  
 \* Indicates Minimum Amount of Time to Assure Valid Data.

## XC4000XL IOB Output Switching Characteristic Guidelines

Testing of switching parameters is modeled after testing methods specified by MIL-M-38510/605. All devices are 100% functionally tested. Internal timing parameters are derived from measuring internal test patterns. Listed below are representative values. For more specific, more precise, and worst-case guaranteed data, use the values reported by the static timing analyzer (TRCE in the Xilinx Development System) and back-annotated to the simulation netlist. These path delays, provided as a guideline, have been extracted from the static timing analyzer report. All timing parameters assume worst-case operating conditions (supply voltage and junction temperature). For Propagation Delays, slew-rate = fast unless otherwise noted. Values are expressed in nanoseconds unless otherwise noted.

		-3		-2		-1		-09		-08	
Description	Symbol	Min	Max	Min	Max	Min	Max	Min	Max	Min	Max
<b>Clocks</b>											
Clock High	T <sub>CH</sub>	3.0		2.8		2.5		2.3		2.1	
Clock Low	T <sub>CL</sub>	3.0		2.8		2.5		2.3		2.1	
<b>Propagation Delays</b>											
Clock (OK) to Pad	T <sub>OKPOF</sub>		5.0		4.3		3.8		3.5		3.3
Output (O) to Pad	T <sub>OPF</sub>		4.1		3.6		3.1		3.0		2.8
3-state to Pad hi-Z (slew-rate independent)	T <sub>TSHZ</sub>		4.0		3.5		3.0		2.9		2.9
3-state to Pad active and valid	T <sub>TSONF</sub>		4.4		3.8		3.3		3.3		3.3
Output (O) to Pad via Fast Output MUX	T <sub>OFFPF</sub>		5.5		4.8		4.2		4.0		3.7
Select (OK) to Pad via Fast MUX	T <sub>OKFPF</sub>		5.1		4.5		3.9		3.7		3.4
<b>Setup and Hold Times</b>											
Output (O) to clock (OK) setup time	T <sub>OOK</sub>	0.5		0.4		0.3		0.3		0.3	
Output (O) to clock (OK) hold time	T <sub>OKO</sub>	0.0		0.0		0.0		0.0		0.0	
Clock Enable (EC) to clock (OK) setup time	T <sub>ECOK</sub>	0.0		0.0		0.0		0.0		0.0	
Clock Enable (EC) to clock (OK) hold time	T <sub>OKEC</sub>	0.3		0.2		0.1		0.0		0.0	
<b>Global Set/Reset</b>											
Minimum GSR pulse width	T <sub>MRW</sub>	19.8		17.3		15.0		14.0		14.0	
Delay from GSR input to any Pad	T <sub>RPO*</sub>										
XC4002XL			14.3		12.5		10.9		10.3		14.0
XC4005XL			15.9		13.8		12.0		11.4		
XC4010XL			18.5		16.1		14.0		13.3		
XC4013XL			20.5		17.8		15.5		14.7		
XC4020XL			23.2		20.1		17.5		16.6		
XC4028XL			25.1		21.9		19.0		17.6		
XC4036XL			27.1		23.6		20.5		19.4		19.3
XC4044XL			29.7		25.9		22.5		21.4		
XC4052XL			31.7		27.6		24.0		22.8		
XC4062XL			33.7		29.3		25.5		24.2		23.5
XC4085XL			39.0		33.9		29.5		28.0		
<b>Slew Rate Adjustment</b>											
For output SLOW option add	T <sub>SLOW</sub>		3.0		2.5		2.0		1.7		1.6

Note: Output timing is measured at ~50% V<sub>CC</sub> threshold, with 50 pF external capacitive loads.

\* Indicates Minimum Amount of Time to Assure Valid Data.

## Revision Control

Version	Nature of Changes
02/01/1999 (1.5)	Release included in the 1999 data book, section 6
05/14/1999 (1.6)	Replaced Electrical Specification and pinout pages for E, EX, and XL families with separate updates and added URL link on placeholder page for electrical specifications/pinouts for WebLINX users
09/30/1999 (1.7)	Added Power-on specification.
10/18/1999 (1.8)	Corrected posted file to include missing page (IOB Output Parameters).
03/01/2013 (2.0)	The products listed in this data sheet are obsolete. See <a href="#">XCN08011</a> for further information.
