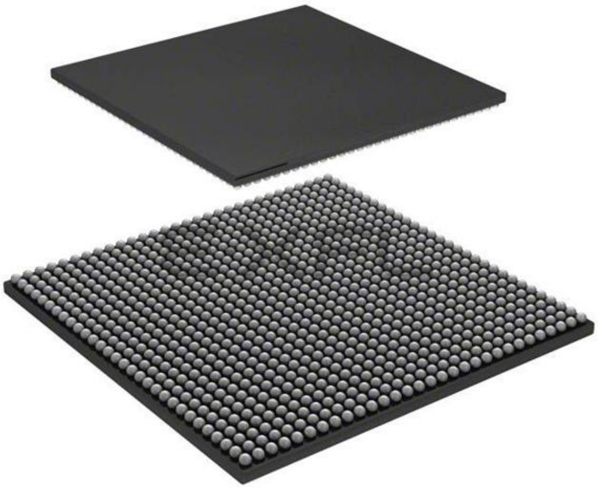
AMD Xilinx - XCKU035-1FBVA900I Datasheet



Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Active
Number of LABs/CLBs	25391
Number of Logic Elements/Cells	444343
Total RAM Bits	19456000
Number of I/O	468
Number of Gates	-
Voltage - Supply	0.922V ~ 0.979V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	900-BBGA, FCBGA
Supplier Device Package	900-FCBGA (31x31)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xcku035-1fbva900i

Summary of Features

Processing System Overview

UltraScale+ MPSoCs feature dual and quad core variants of the ARM Cortex-A53 (APU) with dual-core ARM Cortex-R5 (RPU) processing system (PS). Some devices also include a dedicated ARM Mali™-400 MP2 graphics processing unit (GPU). See Table 2.

Table 2: **Zynq UltraScale+ MPSoC Device Features**

	CG Devices	EG Devices	EV Devices
APU	Dual-core ARM Cortex-A53	Quad-core ARM Cortex-A53	Quad-core ARM Cortex-A53
RPU	Dual-core ARM Cortex-R5	Dual-core ARM Cortex-R5	Dual-core ARM Cortex-R5
GPU	–	Mali-400MP2	Mali-400MP2
VCU	–	–	H.264/H.265

To support the processors' functionality, a number of peripherals with dedicated functions are included in the PS. For interfacing to external memories for data or configuration storage, the PS includes a multi-protocol dynamic memory controller, a DMA controller, a NAND controller, an SD/eMMC controller and a Quad SPI controller. In addition to interfacing to external memories, the APU also includes a Level-1 (L1) and Level-2 (L2) cache hierarchy; the RPU includes an L1 cache and Tightly Coupled memory subsystem. Each has access to a 256KB on-chip memory.

For high-speed interfacing, the PS includes 4 channels of transmit (TX) and receive (RX) pairs of transceivers, called PS-GTR transceivers, supporting data rates of up to 6.0Gb/s. These transceivers can interface to the high-speed peripheral blocks to support PCIe Gen2 root complex or end point in x1, x2, or x4 configurations; Serial-ATA (SATA) at 1.5Gb/s, 3.0Gb/s, or 6.0Gb/s data rates; and up to two lanes of Display Port at 1.62Gb/s, 2.7Gb/s, or 5.4Gb/s data rates. The PS-GTR transceivers can also interface to components over USB 3.0 and Serial Gigabit Media Independent Interface (SGMII).

For general connectivity, the PS includes: a pair of USB 2.0 controllers, which can be configured as host, device, or On-The-Go (OTG); an I2C controller; a UART; and a CAN2.0B controller that conforms to ISO11898-1. There are also four triple speed Ethernet MACs and 128 bits of GPIO, of which 78 bits are available through the MIO and 96 through the EMIO.

High-bandwidth connectivity based on the ARM AMBA® AXI4 protocol connects the processing units with the peripherals and provides interface between the PS and the programmable logic (PL).

For additional information, go to: DS891, *Zynq UltraScale+ MPSoC Overview*.

Migrating Devices

UltraScale and UltraScale+ families provide footprint compatibility to enable users to migrate designs from one device or family to another. Any two packages with the same footprint identifier code are footprint compatible. For example, Kintex UltraScale devices in the A1156 packages are footprint compatible with Kintex UltraScale+ devices in the A1156 packages. Likewise, Virtex UltraScale devices in the B2104 packages are compatible with Virtex UltraScale+ devices and Kintex UltraScale devices in the B2104 packages. All valid device/package combinations are provided in the Device-Package Combinations and Maximum I/Os tables in this document. Refer to UG583, *UltraScale Architecture PCB Design User Guide* for more detail on migrating between UltraScale and UltraScale+ devices and packages.

Kintex UltraScale+ FPGA Feature Summary

Table 5: **Kintex UltraScale+ FPGA Feature Summary**

	KU3P	KU5P	KU9P	KU11P	KU13P	KU15P
System Logic Cells	355,950	474,600	599,550	653,100	746,550	1,143,450
CLB Flip-Flops	325,440	433,920	548,160	597,120	682,560	1,045,440

FFVE1517	40x40				96, 416 32, 20		96, 416 32, 24
FFVA1760	42.5x42.5						96, 416 44, 32
FFVE1760	42.5x42.5						96, 572 32, 24

Notes:

1. Go to Ordering Information for package designation details.
2. FF packages have 1.0mm ball pitch. SF packages have 0.8mm ball pitch.
3. GTY transceiver line rates are package limited: SFVB784 to 12.5Gb/s; FFVA676, FFVD900, and FFVA1156 to 16.3Gb/s.
4. Packages with the same last letter and number sequence, e.g., A676, are footprint compatible with all other UltraScale architecture-based devices with the same sequence. The footprint compatible devices within this family are outlined. See the UltraScale Architecture Product Selection Guide for details on inter-family migration.

Virtex UltraScale FPGA Feature Summary

Table 7: **Virtex UltraScale FPGA Feature Summary**

	VU065	VU080	VU095	VU125	VU160	VU190	VU440
System Logic Cells	783,300	975,000	1,176,000	1,566,600	2,026,500	2,349,900	5,540,850

Notes:

1. Go to Ordering Information for package designation details.
2. FB/FF packages have 1.0mm ball pitch. SB/SF packages have 0.8mm ball pitch.
3. All device package combinations bond out 4 PS-GTR transceivers.
4. All device package combinations bond out 214 PS I/O except ZU2EG and ZU3EG in the SBVA484 and SFVA625 packages, which bond out 170 PS I/Os.
5. Packages with the same last letter and number sequence, e.g., A484, are footprint compatible with all other UltraScale architecture-based devices with the same sequence. The footprint compatible devices within this family are outlined.
6. All 58 HP I/O pins are powered by the same V_{CCO} supply.
7. GTH transceivers in the SFVC784 package support data rates up to 12.5Gb/s.

Zynq UltraScale+: EG Device Feature Summary

Table 15: **Zynq UltraScale+: EV Device Feature Summary**

	ZU4EV	ZU5EV	ZU7EV
Application Processing Unit	Quad-core ARM Cortex-A53 MPCore with CoreSight; NEON & Single/Double Precision Floating Point; 32KB/32KB L1 Cache, 1MB L2 Cache		
Real-Time Processing Unit	Dual-core ARM Cortex-R5 with CoreSight; Single/Double Precision Floating Point; 32KB/32KB L1 Cache, and TCM		
Embedded and External Memory	256KB On-Chip Memory w/ECC; External DDR4; DDR3; DDR3L; LPDDR4; LPDDR3; External Quad-SPI; NAND; eMMC		
General Connectivity	214 PS I/O; UART; CAN; USB 2.0; I2C; SPI; 32b GPIO; Real Time Clock; WatchDog Timers; Triple Timer Counters		
High-Speed Connectivity	4 PS-GTR; PCIe Gen1/2; Serial ATA 3.1; DisplayPort 1.2a; USB 3.0; SGMII		
Graphic Processing Unit	ARM Mali-400 MP2; 64KB L2 Cache		
Video Codec	1	1	1
System Logic Cells	192,150	256,200	504,000
CLB Flip-Flops	175,680	234,240	460,800
CLB LUTs	87,840	117,120	230,400
Distributed RAM (Mb)	2.6	3.5	6.2
Block RAM Blocks	128	144	312
Block RAM (Mb)	4.5	5.1	11.0
UltraRAM Blocks	48	64	96
UltraRAM (Mb)	14.0	18.0	27.0
DSP Slices	728	1,248	1,728
CMTs	4	4	8
Max. HP I/O(1)	156	156	416
Max. HD I/O(2)	96	96	48
System Monitor	2	2	2
GTH Transceiver 16.3Gb/s(3)	16	16	24
GTY Transceivers 32.75Gb/s	0	0	0
Transceiver Fractional PLLs	8	8	12
PCIe Gen3 x16 and Gen4 x8	2	2	2
150G Interlaken	0	0	0
100G Ethernet w/ RS-FEC	0	0	0

Notes:

1. HP = High-performance I/O with support for I/O voltage from 1.0V to 1.8V.
2. HD = High-density I/O with support for I/O voltage from 1.2V to 3.3V.
3. GTH transceivers in the SFVC784 package support data rates up to 12.5Gb/s. See Table 16.

Graphics Processing Unit (GPU)

The dedicated ARM Mali-400 MP2 GPU in the PS supports 2D and 3D graphics acceleration up to 1080p resolution. The Mali-400 supports OpenGL ES 1.1 and 2.0 for 3D graphics and Open VG 1.1 standards for 2D vector graphics. It has a geometry processor (GP) and 2 pixel processors to perform tile rendering operations in parallel. It has dedicated Memory management units for GP and pixel processors, which supports 4 KB page size. The GPU also has 64KB level-2 (L2) read-only cache. It supports 4X and 16X Full scene Anti-Aliasing (FSAA). It is fully autonomous, enabling maximum parallelization between APU and GPU. It has built-in hardware texture decompression, allowing the texture to remain compressed (in ETC format) in graphics hardware and decompress the required samples on the fly. It also supports efficient alpha blending of multiple layers in hardware without additional bandwidth consumption. It has a pixel fill rate of 2Mpixel/sec/MHz and a triangle rate of 0.1Mvertex/sec/MHz. The GPU supports extensive texture format for RGBA 8888, 565, and 1556 in Mono 8, 16, and YUV formats. For power sensitive applications, the GPU supports clock and power gating for each GP, pixel processors, and L2 cache. During power gating, GPU does not consume any static or dynamic power; during clock gating, it only consumes static power.

Video Codec Unit (VCU)

The video codec unit (VCU) provides multi-standard video encoding and decoding capabilities, including: High Efficiency Video Coding (HEVC), i.e., H.265; and Advanced Video Coding (AVC), i.e., H.264 standards. The VCU is capable of simultaneous encode and decode at rates up to 4Kx2K at 60 frames per second (fps) (approx. 600Mpixel/sec) or 8Kx4K at a reduced frame rate (~15fps).

Input/Output

All UltraScale devices, whether FPGA or MPSoC, have I/O pins for communicating to external components. In addition, in the MPSoC’s PS, there are another 78 I/Os that the I/O peripherals use to communicate to external components, referred to as multiplexed I/O (MIO). If more than 78 pins are required by the I/O peripherals, the I/O pins in the PL can be used to extend the MPSoC interfacing capability, referred to as extended MIO (EMIO).

The number of I/O pins in UltraScale FPGAs and in the programmable logic of UltraScale+ MPSoCs varies depending on device and package. Each I/O is configurable and can comply with a large number of I/O standards. The I/Os are classed as high-range (HR), high-performance (HP), or high-density (HD). The HR I/Os offer the widest range of voltage support, from 1.2V to 3.3V. The HP I/Os are optimized for highest performance operation, from 1.0V to 1.8V. The HD I/Os are reduced-feature I/Os organized in banks of 24, providing voltage support from 1.2V to 3.3V.

All I/O pins are organized in banks, with 52 HP or HR pins per bank or 24 HD pins per bank. Each bank has one common V_{CCO} output buffer power supply, which also powers certain input buffers. In addition, HR banks can be split into two half-banks, each with their own V_{CCO} supply. Some single-ended input buffers require an internally generated or an externally applied reference voltage (V_{REF}). V_{REF} pins can be driven directly from the PCB or internally generated using the internal V_{REF} generator circuitry present in each bank.

I/O Electrical Characteristics

Single-ended outputs use a conventional CMOS push/pull output structure driving High towards V_{CCO} or Low towards ground, and can be put into a high-Z state. The system designer can specify the slew rate and the output strength. The input is always active but is usually ignored while the output is active. Each pin can optionally have a weak pull-up or a weak pull-down resistor.

Most signal pin pairs can be configured as differential input pairs or output pairs. Differential input pin pairs can optionally be terminated with a 100Ω internal resistor. All UltraScale devices support differential standards beyond LVDS, including RSDS, BLVDS, differential SSTL, and differential HSTL. Each of the I/Os supports memory I/O standards, such as single-ended and differential HSTL as well as single-ended and differential SSTL. UltraScale+ families add support for MIPI with a dedicated D-PHY in the I/O bank.

3-State Digitally Controlled Impedance and Low Power I/O Features

The 3-state Digitally Controlled Impedance (T_DCI) can control the output drive impedance (series termination) or can provide parallel termination of an input signal to V_{CCO} or split (Thevenin) termination to $V_{CCO}/2$. This allows users to eliminate off-chip termination for signals using T_DCI. In addition to board space savings, the termination automatically turns off when in output mode or when 3-stated, saving considerable power compared to off-chip termination. The I/Os also have low power modes for IBUF and IDELAY to provide further power savings, especially when used to implement memory interfaces.

I/O Logic

Input and Output Delay

All inputs and outputs can be configured as either combinatorial or registered. Double data rate (DDR) is supported by all inputs and outputs. Any input or output can be individually delayed by up to 1,250ps of delay with a resolution of 5–15ps. Such delays are implemented as IDELAY and ODELAY. The number of delay steps can be set by configuration and can also be incremented or decremented while in use. The IDELAY and ODELAY can be cascaded together to double the amount of delay in a single direction.

ISERDES and OSERDES

Many applications combine high-speed, bit-serial I/O with slower parallel operation inside the device. This requires a serializer and deserializer (SerDes) inside the I/O logic. Each I/O pin possesses an IOSERDES (ISERDES and OSERDES) capable of performing serial-to-parallel or parallel-to-serial conversions with programmable widths of 2, 4, or 8 bits. These I/O logic features enable high-performance interfaces, such as Gigabit Ethernet/1000BaseX/SGMII, to be moved from the transceivers to the SelectIO interface.

High-Speed Serial Transceivers

Serial data transmission between devices on the same PCB, over backplanes, and across even longer distances is becoming increasingly important for scaling to 100Gb/s and 400Gb/s line cards. Specialized dedicated on-chip circuitry and differential I/O capable of coping with the signal integrity issues are required at these high data rates.

Three types of transceivers are used in the UltraScale architecture: GTH and GTY in FPGAs and MPSoC PL, and PS-GTR in the MPSoC PS. All transceivers are arranged in groups of four, known as a transceiver Quad. Each serial transceiver is a combined transmitter and receiver. Table 17 compares the available transceivers.

Table 17: **Transceiver Information**

	Kintex UltraScale		**Kintex UltraScale+**		**Virtex UltraScale**		**Virtex UltraScale+**	**Zynq UltraScale+**		
Type	GTH	GTY	GTH	GTY	GTH	GTY	GTY	PS-GTR	GTH	GTY

The following information in this section pertains to the GTH and GTY only.

The serial transmitter and receiver are independent circuits that use an advanced phase-locked loop (PLL) architecture to multiply the reference frequency input by certain programmable numbers between 4 and 25 to become the bit-serial data clock. Each transceiver has a large number of user-definable features and parameters. All of these can be defined during device configuration, and many can also be modified during operation.

Cache Coherent Interconnect for Accelerators (CCIX)

CCIX is a chip-to-chip interconnect operating at data rates up to 25Gb/s that allows two or more devices to share memory in a cache coherent manner. Using PCIe for the transport layer, CCIX can operate at several standard data rates (2.5, 5, 8, and 16Gb/s) with an additional high-speed 25Gb/s option. The specification employs a subset of full coherency protocols and ensures that FPGAs used as accelerators can coherently share data with processors using different instruction set architectures.

Virtex UltraScale+ HBM devices support CCIX data rates up to 16Gb/s and contain four CCIX ports and at least four integrated blocks for PCIe. Each CCIX port requires the use of one integrated block for PCIe. If not used with a CCIX port, the integrated blocks for PCIe can still be used for PCIe communication.

Integrated Block for Interlaken

Some UltraScale architecture-based devices include integrated blocks for Interlaken. Interlaken is a scalable chip-to-chip interconnect protocol designed to enable transmission speeds from 10Gb/s to 150Gb/s. The Interlaken integrated block in the UltraScale architecture is compliant to revision 1.2 of the Interlaken specification with data striping and de-striping across 1 to 12 lanes. Permitted configurations are: 1 to 12 lanes at up to 12.5Gb/s and 1 to 6 lanes at up to 25.78125Gb/s, enabling flexible support for up to 150Gb/s per integrated block. With multiple Interlaken blocks, certain UltraScale devices enable easy, reliable Interlaken switches and bridges.

Integrated Block for 100G Ethernet

Compliant to the IEEE Std 802.3ba, the 100G Ethernet integrated blocks in the UltraScale architecture provide low latency 100Gb/s Ethernet ports with a wide range of user customization and statistics gathering. With support for 10 x 10.3125Gb/s (CAUI) and 4 x 25.78125Gb/s (CAUI-4) configurations, the integrated block includes both the 100G MAC and PCS logic with support for IEEE Std 1588v2 1-step and 2-step hardware timestamping.

In UltraScale+ devices, the 100G Ethernet blocks contain a Reed Solomon Forward Error Correction (RS-FEC) block, compliant to IEEE Std 802.3bj, that can be used with the Ethernet block or stand alone in user applications. These families also support OTN mapping mode in which the PCS can be operated without using the MAC.

After copying the FSBL to OCM, the processor executes the FSBL. Xilinx supplies example FSBLs or users can create their own. The FSBL initiates the boot of the PS and can load and configure the PL, or configuration of the PL can be deferred to a later stage. The FSBL typically loads either a user application or an optional second stage boot loader (SSBL) such as U-Boot. Users obtain example SSBL from Xilinx or a third party, or they can create their own SSBL. The SSBL continues the boot process by loading code from any of the primary boot devices or from other sources such as USB, Ethernet, etc. If the FSBL did not configure the PL, the SSBL can do so, or again, the configuration can be deferred to a later stage.

The static memory interface controller (NAND, eMMC, or Quad-SPI) is configured using default settings. To improve device configuration speed, these settings can be modified by information provided in the boot image header. The ROM boot image is not user readable or executable after boot.

Configuring FPGAs

The SPI (serial NOR) interface (x1, x2, x4, and dual x4 modes) and the BPI (parallel NOR) interface (x8 and x16 modes) are two common methods used for configuring the FPGA. Users can directly connect an SPI or BPI flash to the FPGA, and the FPGA's internal configuration logic reads the bitstream out of the flash and configures itself, eliminating the need for an external controller. The FPGA automatically detects the bus width on the fly, eliminating the need for any external controls or switches. Bus widths supported are x1, x2, x4, and dual x4 for SPI, and x8 and x16 for BPI. The larger bus widths increase configuration speed and reduce the amount of time it takes for the FPGA to start up after power-on.

In master mode, the FPGA can drive the configuration clock from an internally generated clock, or for higher speed configuration, the FPGA can use an external configuration clock source. This allows high-speed configuration with the ease of use characteristic of master mode. Slave modes up to 32 bits wide that are especially useful for processor-driven configuration are also supported by the FPGA. In addition, the new media configuration access port (MCAP) provides a direct connection between the integrated block for PCIe and the configuration logic to simplify configuration over PCIe.

SEU detection and mitigation (SEM) IP, RSA authentication, post-configuration CRC, and Security Monitor (SecMon) IP are not supported in the KU025 FPGA.

Packaging

The UltraScale devices are available in a variety of organic flip-chip and lidless flip-chip packages supporting different quantities of I/Os and transceivers. Maximum supported performance can depend on the style of package and its material. Always refer to the specific device data sheet for performance specifications by package type.

In flip-chip packages, the silicon device is attached to the package substrate using a high-performance flip-chip process. Decoupling capacitors are mounted on the package substrate to optimize signal integrity under simultaneous switching of outputs (SSO) conditions.

Table 21: **Speed Grade and Temperature Grade *(Cont'd)***

Device Family	Devices	Speed Grade and Temperature Grade			
		Commercial (C)	Extended (E)		Industrial (I)
		0°C to +85°C	0°C to +100°C	0°C to +110°C	–40°C to +100°C
Zynq UltraScale+	CG Devices		-2E (0.85V)		-2I (0.85V)
				-2LE(2)(3) (0.85V or 0.72V)	
			-1E (0.85V)		-1I (0.85V)
					-1LI(3) (0.85V or 0.72V)
	ZU2EG ZU3EG		-2E (0.85V)		-2I (0.85V)
				-2LE(2)(3) (0.85V or 0.72V)	
			-1E (0.85V)		-1I (0.85V)
					-1LI(3) (0.85V or 0.72V)
	ZU4EG ZU5EG ZU6EG ZU7EG ZU9EG ZU11EG ZU15EG ZU17EG ZU19EG		-3E (0.90V)		
			-2E (0.85V)		-2I (0.85V)
				-2LE(2)(3) (0.85V or 0.72V)	
			-1E (0.85V)		-1I (0.85V)
					-1LI(3) (0.85V or 0.72V)
	EV Devices		-3E (0.90V)		
			-2E (0.85V)		-2I (0.85V)
				-2LE(2)(3) (0.85V or 0.72V)	
			-1E (0.85V)		-1I (0.85V)
					-1LI(3) (0.85V or 0.72V)

Notes:

1. KU025 and KU095 are not available in -3E or -1LI speed/temperature grades.
2. In -2LE speed/temperature grade, devices can operate for a limited time with junction temperature of 110°C. Timing parameters adhere to the same speed file at 110°C as they do below 110°C, regardless of operating voltage (nominal at 0.85V or low voltage at 0.72V). Operation at 110°C Tj is limited to 1% of the device lifetime and can occur sequentially or at regular intervals as long as the total time does not exceed 1% of device lifetime.
3. In Zynq UltraScale+ MPSoCs, when operating the PL at low voltage (0.72V), the PS operates at nominal voltage (0.85V).

The ordering information shown in Figure 3 applies to all packages in the Kintex UltraScale and Virtex UltraScale FPGAs. Refer to the Package Marking section of UG575, *UltraScale and UltraScale+ FPGAs Packaging and Pinouts User Guide* for a more detailed explanation of the device markings.

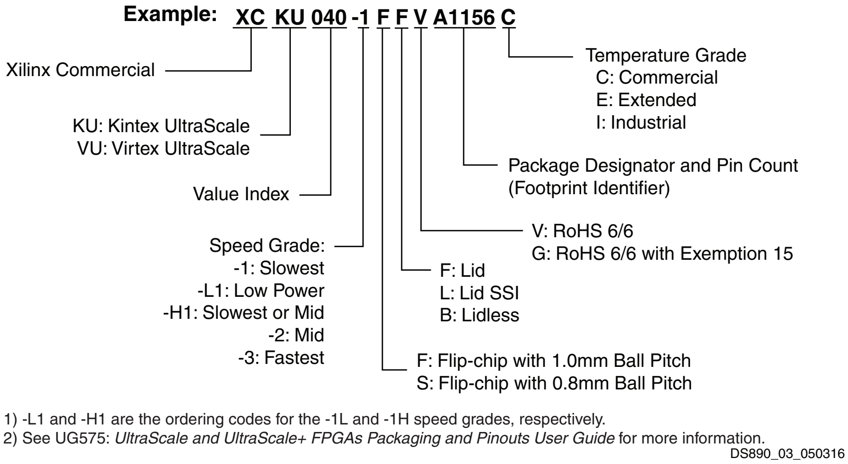

Figure 3: **Kintex UltraScale and Virtex UltraScale FPGA Ordering Information**

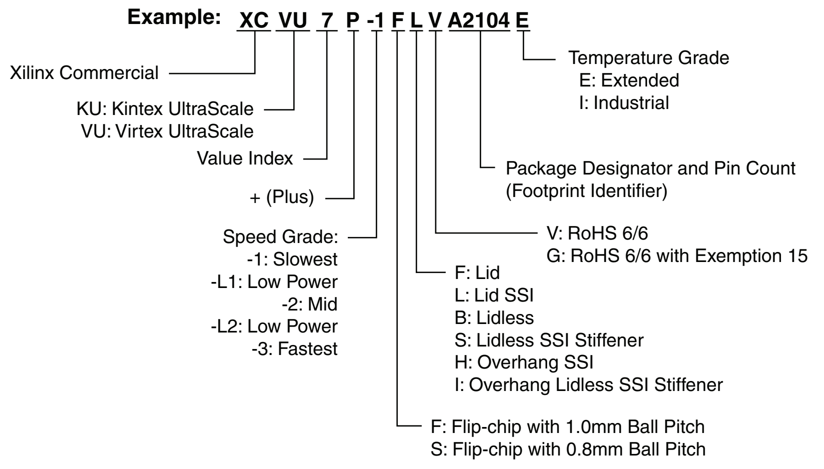
The ordering information shown in Figure 4 applies to all packages in the Kintex UltraScale+ and Virtex UltraScale+ FPGAs, and Figure 5 applies to Zynq UltraScale+s.

The -1L and -2L speed grades in the UltraScale+ families can run at one of two different V_{CCINT} operating voltages. At 0.72V, they operate at similar performance to the Kintex UltraScale and Virtex UltraScale devices with up to 30% reduction in power consumption. At 0.85V, they consume similar power to the Kintex UltraScale and Virtex UltraScale devices, but operate over 30% faster.

For UltraScale+ devices, the information in this document is pre-release, provided ahead of silicon ordering availability. Please contact your Xilinx sales representative for more information on Early Access Programs.



1) -L1 and -L2 are the ordering codes for the low power -1L and -2L speed grades, respectively.

Revision History

The following table shows the revision history for this document:

Date	Version	Description of Revisions
02/15/2017	2.11	Updated Table 1, Table 9: Converted HBM from Gb to GB. Updated Table 11, Table 13, and Table 15: Updated DSP count for Zynq UltraScale+ MPSoCs. Updated Cache Coherent Interconnect for Accelerators (CCIX). Updated High Bandwidth Memory (HBM). Updated Table 21: Added-2E speed grade to all UltraScale+ devices. Removed -3E from XCZU2 and XCZU3.
11/09/2016	2.10	Updated Table 1. Added HBM devices to Table 9, Table 10, Table 19 and new High Bandwidth Memory (HBM) section. Added Cache Coherent Interconnect for Accelerators (CCIX) section.
09/27/2016	2.9	Updated Table 5, Table 12, Table 13, and Table 14.
06/03/2016	2.8	Added Zynq UltraScale+ MPSoC CG devices: Added Table 2. Updated Table 11, Table 12, Table 21, and Figure 5. Created separate tables for EG and EV devices: Table 13, Table 14, Table 15, and Table 16. Updated Table 1, Table 3, Table 5 and notes, Table 6 and notes, Table 7, Table 9, Table 10, Processing System Overview, and Processing System (PS) details.
02/17/2016	2.7	Added Migrating Devices. Updated Table 4, Table 5, Table 6, Table 10, Table 11, Table 12, and Figure 4.
12/15/2015	2.6	Updated Table 1, Table 5, Table 6, Table 9, Table 12, and Configuration.
11/24/2015	2.5	Updated Configuration, Encryption, and System Monitoring, Table 5, Table 9, Table 11, and Table 21.
10/15/2015	2.4	Updated Table 1, Table 3, Table 5, Table 7, Table 9, and Table 11 with System Logic Cells. Updated Figure 3. Updated Table 19.
09/29/2015	2.3	Added A1156 to KU095 in Table 4. Updated Table 5. Updated Max. Distributed RAM in Table 9. Updated Distributed RAM in Table 11. Added Table 19. Updated Table 21. Updated Figure 3.
08/14/2015	2.2	Updated Table 1. Added XCKU025 to Table 3, Table 4, and Table 21. Updated Table 7, Table 9, Table 11, Table 12, Table 18. Updated System Monitor. Added voltage information to Table 21.
04/27/2015	2.1	Updated Table 1, Table 3, Table 4, Table 5, Table 6, Table 7, Table 10, Table 11, Table 12, Table 17, I/O, Transceiver, PCIe, 100G Ethernet, and 150G Interlaken, Integrated Interface Blocks for PCI Express Designs, USB 3.0/2.0, Clock Management, System Monitor, and Figure 3.
02/23/2015	2.0	UltraScale+ device information (Kintex UltraScale+ FPGA, Virtex UltraScale+ FPGA, and Zynq UltraScale+ MPSoC) added throughout document.
12/16/2014	1.6	Updated Table 1; I/O, Transceiver, PCIe, 100G Ethernet, and 150G Interlaken; Table 3, Table 7; Table 8; and Table 17.
11/17/2014	1.5	Updated I/O, Transceiver, PCIe, 100G Ethernet, and 150G Interlaken; Table 1; Table 4; Table 7; Table 8; Table 17; Input/Output; and Figure 3.
09/16/2014	1.4	Updated Logic Cell information in Table 1. Updated Table 3; I/O, Transceiver, PCIe, 100G Ethernet, and 150G Interlaken; Table 7; Table 8; Integrated Block for 100G Ethernet; and Figure 3.
05/20/2014	1.3	Updated Table 8.
05/13/2014	1.2	Added Ordering Information. Updated Table 1, Clocks and Memory Interfaces, Table 3, Table 7 (removed XCVU145; added XCVU190), Table 8 (removed XCVU145; removed FLVD1924 from XCVU160; added XCVU190; updated Table Notes), Table 17, Integrated Interface Blocks for PCI Express Designs, and Integrated Block for Interlaken, and Memory Interfaces.
