

Welcome to E-XFL.COM

Understanding <u>Embedded - FPGAs (Field</u> <u>Programmable Gate Array)</u>

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	37320
Number of Logic Elements/Cells	653100
Total RAM Bits	53964800
Number of I/O	512
Number of Gates	-
Voltage - Supply	0.825V ~ 0.876V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	1517-BBGA, FCBGA
Supplier Device Package	1517-FCBGA (40x40)
Purchase URL	https://www.e-xfl.com/product-detail/xilinx/xcku11p-1ffve1517i

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

Summary of Features

Processing System Overview

UltraScale+ MPSoCs feature dual and quad core variants of the ARM Cortex-A53 (APU) with dual-core ARM Cortex-R5 (RPU) processing system (PS). Some devices also include a dedicated ARM Mali[™]-400 MP2 graphics processing unit (GPU). See Table 2.

	CG Devices	EG Devices	EV Devices								
APU	Dual-core ARM Cortex-A53	Quad-core ARM Cortex-A53	Quad-core ARM Cortex-A53								
RPU	Dual-core ARM Cortex-R5	Dual-core ARM Cortex-R5	Dual-core ARM Cortex-R5								
GPU	_	Mali-400MP2	Mali-400MP2								
VCU	_	_	H.264/H.265								

Table 2: Zynq UltraScale+ MPSoC Device Fe

To support the processors' functionality, a number of peripherals with dedicated functions are included in the PS. For interfacing to external memories for data or configuration storage, the PS includes a multi-protocol dynamic memory controller, a DMA controller, a NAND controller, an SD/eMMC controller and a Quad SPI controller. In addition to interfacing to external memories, the APU also includes a Level-1 (L1) and Level-2 (L2) cache hierarchy; the RPU includes an L1 cache and Tightly Coupled memory subsystem. Each has access to a 256KB on-chip memory.

For high-speed interfacing, the PS includes 4 channels of transmit (TX) and receive (RX) pairs of transceivers, called PS-GTR transceivers, supporting data rates of up to 6.0Gb/s. These transceivers can interface to the high-speed peripheral blocks to support PCIe Gen2 root complex or end point in x1, x2, or x4 configurations; Serial-ATA (SATA) at 1.5Gb/s, 3.0Gb/s, or 6.0Gb/s data rates; and up to two lanes of Display Port at 1.62Gb/s, 2.7Gb/s, or 5.4Gb/s data rates. The PS-GTR transceivers can also interface to components over USB 3.0 and Serial Gigabit Media Independent Interface (SGMII).

For general connectivity, the PS includes: a pair of USB 2.0 controllers, which can be configured as host, device, or On-The-Go (OTG); an I2C controller; a UART; and a CAN2.0B controller that conforms to ISO11898-1. There are also four triple speed Ethernet MACs and 128 bits of GPIO, of which 78 bits are available through the MIO and 96 through the EMIO.

High-bandwidth connectivity based on the ARM AMBA® AXI4 protocol connects the processing units with the peripherals and provides interface between the PS and the programmable logic (PL).

For additional information, go to: <u>DS891</u>, *Zynq UltraScale+ MPSoC Overview*.

Kintex UltraScale FPGA Feature Summary

Table 3: Kintex UltraScale FPGA Feature Summary

	KU025 ⁽¹⁾	KU035	KU040	KU060	KU085	KU095	KU115

GTY 16.3Gb/s Transceivers ⁽⁵⁾	0	0	0	0	0	32	0
Transceiver Fractional PLLs	0	0	0	0	0	16	0

Notes:

1. Certain advanced configuration features are not supported in the KU025. Refer to the Configuring FPGAs section for details.

2. HP = High-performance I/O with support for I/O voltage from 1.0V to 1.8V.

3. HR = High-range I/O with support for I/O voltage from 1.2V to 3.3V.

4. GTH transceivers in SF/FB packages support data rates up to 12.5Gb/s. See Table 4.

5. GTY transceivers in Kintex UltraScale devices support data rates up to 16.3Gb/s. See Table 4.

FFVE1760	42.5x42.5						96, 572 32, 24

Notes:

1. Go to Ordering Information for package designation details.

2. FF packages have 1.0mm ball pitch. SF packages have 0.8mm ball pitch.

3. GTY transceiver line rates are package limited: SFVB784 to 12.5Gb/s; FFVA676, FFVD900, and FFVA1156 to 16.3Gb/s.

4. Packages with the same last letter and number sequence, e.g., A676, are footprint compatible with all other UltraScale architecture-based devices with the same sequence. The footprint compatible devices within this family are outlined. See the <u>UltraScale Architecture Product Selection Guide</u> for details on inter-family migration.

Notes:

- 1. Go to Ordering Information for package designation details.
- 2. FB/FF packages have 1.0mm ball pitch. SB/SF packages have 0.8mm ball pitch.
- 3. All device package combinations bond out 4 PS-GTR transceivers.
- 4. All device package combinations bond out 214 PS I/O except ZU2EG and ZU3EG in the SBVA484 and SFVA625 packages, which bond out 170 PS I/Os.
- 5. Packages with the same last letter and number sequence, e.g., A484, are footprint compatible with all other UltraScale architecture-based devices with the same sequence. The footprint compatible devices within this family are outlined.
- 6. All 58 HP I/O pins are powered by the same V_{CCO} supply.
- 7. GTH transceivers in the SFVC784 package support data rates up to 12.5Gb/s.

www.xilinx.com

Graphics Processing Unit (GPU)

The dedicated ARM Mali-400 MP2 GPU in the PS supports 2D and 3D graphics acceleration up to 1080p resolution. The Mali-400 supports OpenGL ES 1.1 and 2.0 for 3D graphics and Open VG 1.1 standards for 2D vector graphics. It has a geometry processor (GP) and 2 pixel processors to perform tile rendering operations in parallel. It has dedicated Memory management units for GP and pixel processors, which supports 4 KB page size. The GPU also has 64KB level-2 (L2) read-only cache. It supports 4X and 16X Full scene Anti-Aliasing (FSAA). It is fully autonomous, enabling maximum parallelization between APU and GPU. It has built-in hardware texture decompression, allowing the texture to remain compressed (in ETC format) in graphics hardware and decompress the required samples on the fly. It also supports efficient alpha blending of multiple layers in hardware without additional bandwidth consumption. It has a pixel fill rate of 2Mpixel/sec/MHz and a triangle rate of 0.1Mvertex/sec/MHz. The GPU supports extensive texture format for RGBA 8888, 565, and 1556 in Mono 8, 16, and YUV formats. For power sensitive applications, the GPU supports clock and power gating for each GP, pixel processors, and L2 cache. During power gating, GPU does not consume any static or dynamic power; during clock gating, it only consumes static power.

Video Codec Unit (VCU)

The video codec unit (VCU) provides multi-standard video encoding and decoding capabilities, including: High Efficiency Video Coding (HEVC), i.e., H.265; and Advanced Video Coding (AVC), i.e., H.264 standards. The VCU is capable of simultaneous encode and decode at rates up to 4Kx2K at 60 frames per second (fps) (approx. 600Mpixel/sec) or 8Kx4K at a reduced frame rate (~15fps).

Input/Output

All UltraScale devices, whether FPGA or MPSoC, have I/O pins for communicating to external components. In addition, in the MPSoC's PS, there are another 78 I/Os that the I/O peripherals use to communicate to external components, referred to as multiplexed I/O (MIO). If more than 78 pins are required by the I/O peripherals, the I/O pins in the PL can be used to extend the MPSoC interfacing capability, referred to as extended MIO (EMIO).

The number of I/O pins in UltraScale FPGAs and in the programmable logic of UltraScale+ MPSoCs varies depending on device and package. Each I/O is configurable and can comply with a large number of I/O standards. The I/Os are classed as high-range (HR), high-performance (HP), or high-density (HD). The HR I/Os offer the widest range of voltage support, from 1.2V to 3.3V. The HP I/Os are optimized for highest performance operation, from 1.0V to 1.8V. The HD I/Os are reduced-feature I/Os organized in banks of 24, providing voltage support from 1.2V to 3.3V.

All I/O pins are organized in banks, with 52 HP or HR pins per bank or 24 HD pins per bank. Each bank has one common V_{CCO} output buffer power supply, which also powers certain input buffers. In addition, HR banks can be split into two half-banks, each with their own V_{CCO} supply. Some single-ended input buffers require an internally generated or an externally applied reference voltage (V_{REF}). V_{REF} pins can be driven directly from the PCB or internally generated using the internal V_{REF} generator circuitry present in each bank.

Transmitter

The transmitter is fundamentally a parallel-to-serial converter with a conversion ratio of 16, 20, 32, 40, 64, or 80 for the GTH and 16, 20, 32, 40, 64, 80, 128, or 160 for the GTY. This allows the designer to trade off datapath width against timing margin in high-performance designs. These transmitter outputs drive the PC board with a single-channel differential output signal. TXOUTCLK is the appropriately divided serial data clock and can be used directly to register the parallel data coming from the internal logic. The incoming parallel data is fed through an optional FIFO and has additional hardware support for the 8B/10B, 64B/66B, or 64B/67B encoding schemes to provide a sufficient number of transitions. The bit-serial output signal drives two package pins with differential signals. This output signal pair has programmable signal swing as well as programmable pre- and post-emphasis to compensate for PC board losses and other interconnect characteristics. For shorter channels, the swing can be reduced to reduce power consumption.

Receiver

The receiver is fundamentally a serial-to-parallel converter, changing the incoming bit-serial differential signal into a parallel stream of words, each 16, 20, 32, 40, 64, or 80 bits in the GTH or 16, 20, 32, 40, 64, 80, 128, or 160 for the GTY. This allows the designer to trade off internal datapath width against logic timing margin. The receiver takes the incoming differential data stream, feeds it through programmable DC automatic gain control, linear and decision feedback equalizers (to compensate for PC board, cable, optical and other interconnect characteristics), and uses the reference clock input to initiate clock recognition. There is no need for a separate clock line. The data pattern uses non-return-to-zero (NRZ) encoding and optionally ensures sufficient data transitions by using the selected encoding scheme. Parallel data is then transferred into the device logic using the RXUSRCLK clock. For short channels, the transceivers offer a special low-power mode (LPM) to reduce power consumption by approximately 30%. The receiver DC automatic gain control and linear and decision feedback equalizers can optionally "auto-adapt" to automatically learn and compensate for different interconnect characteristics. This enables even more margin for 10G+ and 25G+ backplanes.

Out-of-Band Signaling

The transceivers provide out-of-band (OOB) signaling, often used to send low-speed signals from the transmitter to the receiver while high-speed serial data transmission is not active. This is typically done when the link is in a powered-down state or has not yet been initialized. This benefits PCIe and SATA/SAS and QPI applications.

The MMCM can have a fractional counter in either the feedback path (acting as a multiplier) or in one output path. Fractional counters allow non-integer increments of 1/8 and can thus increase frequency synthesis capabilities by a factor of 8. The MMCM can also provide fixed or dynamic phase shift in small increments that depend on the VCO frequency. At 1,600MHz, the phase-shift timing increment is 11.2ps.

PLL

With fewer features than the MMCM, the two PLLs in a clock management tile are primarily present to provide the necessary clocks to the dedicated memory interface circuitry. The circuit at the center of the PLLs is similar to the MMCM, with PFD feeding a VCO and programmable M, D, and O counters. There are two divided outputs to the device fabric per PLL as well as one clock plus one enable signal to the memory interface circuitry.

UltraScale+ MPSoCs are equipped with five additional PLLs in the PS for independently configuring the four primary clock domains with the PS: the APU, the RPU, the DDR controller, and the I/O peripherals.

Clock Distribution

Clocks are distributed throughout UltraScale devices via buffers that drive a number of vertical and horizontal tracks. There are 24 horizontal clock routes per clock region and 24 vertical clock routes per clock region with 24 additional vertical clock routes adjacent to the MMCM and PLL. Within a clock region, clock signals are routed to the device logic (CLBs, etc.) via 16 gateable leaf clocks.

Several types of clock buffers are available. The BUFGCE and BUFCE_LEAF buffers provide clock gating at the global and leaf levels, respectively. BUFGCTRL provides glitchless clock muxing and gating capability. BUFGCE_DIV has clock gating capability and can divide a clock by 1 to 8. BUFG_GT performs clock division from 1 to 8 for the transceiver clocks. In MPSoCs, clocks can be transferred from the PS to the PL using dedicated buffers.

Memory Interfaces

Memory interface data rates continue to increase, driving the need for dedicated circuitry that enables high performance, reliable interfacing to current and next-generation memory technologies. Every UltraScale device includes dedicated physical interfaces (PHY) blocks located between the CMT and I/O columns that support implementation of high-performance PHY blocks to external memories such as DDR4, DDR3, QDRII+, and RLDRAM3. The PHY blocks in each I/O bank generate the address/control and data bus signaling protocols as well as the precision clock/data alignment required to reliably communicate with a variety of high-performance memory standards. Multiple I/O banks can be used to create wider memory interfaces.

As well as external parallel memory interfaces, UltraScale FPGAs and MPSoCs can communicate to external serial memories, such as Hybrid Memory Cube (HMC), via the high-speed serial transceivers. All transceivers in the UltraScale architecture support the HMC protocol, up to 15Gb/s line rates. UltraScale devices support the highest bandwidth HMC configuration of 64 lanes with a single FPGA.

UltraRAM

UltraRAM is a high-density, dual-port, synchronous memory block available in UltraScale+ devices. Both of the ports share the same clock and can address all of the 4K x 72 bits. Each port can independently read from or write to the memory array. UltraRAM supports two types of write enable schemes. The first mode is consistent with the block RAM byte write enable mode. The second mode allows gating the data and parity byte writes separately. UltraRAM blocks can be connected together to create larger memory arrays. Dedicated routing in the UltraRAM column enables the entire column height to be connected together. If additional density is required, all the UltraRAM columns in an SLR can be connected together with a few fabric resources to create single instances of RAM approximately 100Mb in size. This makes UltraRAM an ideal solution for replacing external memories such as SRAM. Cascadable anywhere from 288Kb to 100Mb, UltraRAM provides the flexibility to fulfill many different memory requirements.

Error Detection and Correction

Each 64-bit-wide UltraRAM can generate, store and utilize eight additional Hamming code bits and perform single-bit error correction and double-bit error detection (ECC) during the read process.

High Bandwidth Memory (HBM)

Virtex UltraScale+ HBM devices incorporate 4GB HBM stacks adjacent to the FPGA die. Using stacked silicon interconnect technology, the FPGA communicates to the HBM stacks through memory controllers that connect to dedicated low-inductance interconnect in the silicon interposer. Each Virtex UltraScale+ HBM FPGA contains one or two HBM stacks, resulting in up to 8GB of HBM per FPGA.

The FPGA has 32 HBM AXI interfaces used to communicate with the HBM. Through a built-in switch mechanism, any of the 32 HBM AXI interfaces can access any memory address on either one or both of the HBM stacks due to the flexible addressing feature. This flexible connection between the FPGA and the HBM stacks results in easy floorplanning and timing closure. The memory controllers perform read and write reordering to improve bus efficiency. Data integrity is ensured through error checking and correction (ECC) circuitry.

Configurable Logic Block

Every Configurable Logic Block (CLB) in the UltraScale architecture contains 8 LUTs and 16 flip-flops. The LUTs can be configured as either one 6-input LUT with one output, or as two 5-input LUTs with separate outputs but common inputs. Each LUT can optionally be registered in a flip-flop. In addition to the LUTs and flip-flops, the CLB contains arithmetic carry logic and multiplexers to create wider logic functions.

Each CLB contains one slice. There are two types of slices: SLICEL and SLICEM. LUTs in the SLICEM can be configured as 64-bit RAM, as 32-bit shift registers (SRL32), or as two SRL16s. CLBs in the UltraScale architecture have increased routing and connectivity compared to CLBs in previous-generation Xilinx devices. They also have additional control signals to enable superior register packing, resulting in overall higher device utilization.

Zynq UltraScale+ MPSoCs contain an additional System Monitor block in the PS. See Table 20.

Table 20: Key System Monitor Features

	Kintex UltraScale Virtex UltraScale	Kintex UltraScale+ Virtex UltraScale+ Zynq UltraScale+ MPSoC PL	Zynq UltraScale+ MPSoC PS
ADC	10-bit 200kSPS	10-bit 200kSPS	10-bit 1MSPS
Interfaces	JTAG, I2C, DRP	JTAG, I2C, DRP, PMBus	APB

In FPGAs and the MPSoC PL, sensor outputs and up to 17 user-allocated external analog inputs are digitized using a 10-bit 200 kilo-sample-per-second (kSPS) ADC, and the measurements are stored in registers that can be accessed via internal FPGA (DRP), JTAG, PMBus, or I2C interfaces. The I2C interface and PMBus allow the on-chip monitoring to be easily accessed by the System Manager/Host before and after device configuration.

The System Monitor in the MPSoC PS uses a 10-bit, 1 mega-sample-per-second (MSPS) ADC to digitize the sensor outputs. The measurements are stored in registers and are accessed via the Advanced Peripheral Bus (APB) interface by the processors and the platform management unit (PMU) in the PS.

Configuration

The UltraScale architecture-based devices store their customized configuration in SRAM-type internal latches. The configuration storage is volatile and must be reloaded whenever the device is powered up. This storage can also be reloaded at any time. Several methods and data formats for loading configuration are available, determined by the mode pins, with more dedicated configuration datapath pins to simplify the configuration process.

UltraScale architecture-based devices support secure and non-secure boot with optional Advanced Encryption Standard - Galois/Counter Mode (AES-GCM) decryption and authentication logic. If only authentication is required, the UltraScale architecture provides an alternative form of authentication in the form of RSA algorithms. For RSA authentication support in the Kintex UltraScale and Virtex UltraScale families, go to <u>UG570</u>, *UltraScale Architecture Configuration User Guide*.

UltraScale architecture-based devices also have the ability to select between multiple configurations, and support robust field-update methodologies. This is especially useful for updates to a design after the end product has been shipped. Designers can release their product with an early version of the design, thus getting their product to market faster. This feature allows designers to keep their customers current with the most up-to-date design while the product is already deployed in the field.

Booting MPSoCs

Zynq UltraScale+ MPSoCs use a multi-stage boot process that supports both a non-secure and a secure boot. The PS is the master of the boot and configuration process. For a secure boot, the AES-GCM, SHA-3/384 decryption/authentication, and 4096-bit RSA blocks decrypt and authenticate the image.

Upon reset, the device mode pins are read to determine the primary boot device to be used: NAND, Quad-SPI, SD, eMMC, or JTAG. JTAG can only be used as a non-secure boot source and is intended for debugging purposes. One of the CPUs, Cortex-A53 or Cortex-R5, executes code out of on-chip ROM and copies the first stage boot loader (FSBL) from the boot device to the on-chip memory (OCM).

Ordering Information

Table 21 shows the speed and temperature grades available in the different device families. V_{CCINT} supply voltage is listed in parentheses.

	Devices	Speed Grade and Temperature Grade						
Device Family		Commercial (C)	Ex	ttended (E)	Industrial (I)			
		0°C to +85°C	0°C to +100°C	0°C to +110°C	–40°C to +100°C			
			-3E ⁽¹⁾ (1.0V)

					-1LI ⁽³⁾ (0.85V or 0.72V)			

Table 21: Speed Grade and Temperature Grade (Cont'd)

Notes:

1. KU025 and KU095 are not available in -3E or -1LI speed/temperature grades.

In -2LE speed/temperature grade, devices can operate for a limited time with junction temperature of 110°C. Timing parameters adhere to the same speed file at 110°C as they do below 110°C, regardless of operating voltage (nominal at 0.85V or low voltage at 0.72V). Operation at 110°C Tj is limited to 1% of the device lifetime and can occur sequentially or at regular intervals as long as the total time does not exceed 1% of device lifetime.

3. In Zynq UltraScale+ MPSoCs, when operating the PL at low voltage (0.72V), the PS operates at nominal voltage (0.85V).

E XILINX.

The ordering information shown in Figure 3 applies to all packages in the Kintex UltraScale and Virtex UltraScale FPGAs. Refer to the Package Marking section of <u>UG575</u>, *UltraScale and UltraScale+ FPGAs Packaging and Pinouts User Guide* for a more detailed explanation of the device markings.

 L1 and -H1 are the ordering codes for the -1L and -1H speed grades, respectively.
See UG575: UltraScale and UltraScale+ FPGAs Packaging and Pinouts User Guide for more information. DS890_03_050316

Figure 3: Kintex UltraScale and Virtex UltraScale FPGA Ordering Information

The ordering information shown in Figure 4 applies to all packages in the Kintex UltraScale+ and Virtex UltraScale+ FPGAs, and Figure 5 applies to Zynq UltraScale+s.

The -1L and -2L speed grades in the UltraScale+ families can run at one of two different V_{CCINT} operating voltages. At 0.72V, they operate at similar performance to the Kintex UltraScale and Virtex UltraScale devices with up to 30% reduction in power consumption. At 0.85V, they consume similar power to the Kintex UltraScale and Virtex UltraScale devices, but operate over 30% faster.

For UltraScale+ devices, the information in this document is pre-release, provided ahead of silicon ordering availability. Please contact your Xilinx sales representative for more information on Early Access Programs.

1) -L1 and -L2 are the ordering codes for the low power -1L and -2L speed grades, respectively.

Revision History

The following table shows the revision history for this document:

Date	Version	Description of Revisions		
02/15/2017	2.11	Updated Table 1, Table 9: Converted HBM from Gb to GB. Updated Table 11, Table 13, and Table 15: Updated DSP count for Zynq UltraScale+ MPSoCs. Updated Cache Coherent Interconnect for Accelerators (CCIX). Updated High Bandwidth Memory (HBM). Updated Table 21: Added-2E speed grade to all UltraScale+ devices. Removed -3E from XCZU2 and XCZU3.		
11/09/2016	2.10	Updated Table 1. Added HBM devices to Table 9, Table 10, Table 19 and new High Bandwidth Memory (HBM) section. Added Cache Coherent Interconnect for Accelerators (CCIX) section.		
09/27/2016	2.9	Updated Table 5, Table 12, Table 13, and Table 14.		
06/03/2016	2.8	Added Zynq UltraScale + MPSoC CG devices: Added Table 2. Updated Table 11, Table 12, Table 21, and Figure 5. Created separate tables for EG and EV devices: Table 13, Table 14, Table 15, and Table 16. Updated Table 1, Table 3, Table 5 and notes, Table 6 and notes, Table 7, Table 9, Table 10, Processing System Overview, and Processing System (PS) details		
02/17/2016	2.7	Added Migrating Devices. Updated Table 4, Table 5, Table 6, Table 10, Table 11, Table 12, and Figure 4.		
12/15/2015	2.6	Updated Table 1, Table 5, Table 6, Table 9, Table 12, and Configuration.		
11/24/2015	2.5	Updated Configuration, Encryption, and System Monitoring, Table 5, Table 9, Table 11, and Table 21.		
10/15/2015	2.4	Updated Table 1, Table 3, Table 5, Table 7, Table 9, and Table 11 with System Logic Cells. Updated Figure 3. Updated Table 19.		
09/29/2015	2.3	Added A1156 to KU095 in Table 4. Updated Table 5. Updated Max. Distributed RAM in Table 9. Updated Distributed RAM in Table 11. Added Table 19. Updated Table 21. Updated Figure 3.		
08/14/2015	2.2	Updated Table 1. Added XCKU025 to Table 3, Table 4, and Table 21. Updated Table 7, Table 9, Table 11, Table 12, Table 18. Updated System Monitor. Added voltage information to Table 21.		
04/27/2015	2.1	Updated Table 1, Table 3, Table 4, Table 5, Table 6, Table 7, Table 10, Table 11, Table 12, Table 17, I/O, Transceiver, PCIe, 100G Ethernet, and 150G Interlaken, Integrated Interface Blocks for PCI Express Designs, USB 3.0/2.0, Clock Management, System Monitor, and Figure 3.		
02/23/2015	2.0	UltraScale+ device information (Kintex UltraScale+ FPGA, Virtex UltraScale+ FPGA, and Zynq UltraScale+ MPSoC) added throughout document.		
12/16/2014	1.6	Updated Table 1; I/O, Transceiver, PCIe, 100G Ethernet, and 150G Interlaken; Table 3, Table 7; Table 8; and Table 17.		
11/17/2014	1.5	Updated I/O, Transceiver, PCIe, 100G Ethernet, and 150G Interlaken; Table 1; Table 4; Table 7; Table 8; Table 17; Input/Output; and Figure 3.		
09/16/2014	1.4	Updated Logic Cell information in Table 1. Updated Table 3; I/O, Transceiver, PCIe, 100G Ethernet, and 150G Interlaken; Table 7; Table 8; Integrated Block for 100G Ethernet; and Figure 3.		
05/20/2014	1.3	Updated Table 8.		
05/13/2014	1.2	Added Ordering Information. Updated Table 1, Clocks and Memory Interfaces, Table 3, Table 7 (removed XCVU145; added XCVU190), Table 8 (removed XCVU145; removed FLVD1924 from XCVU160; added XCVU190; updated Table Notes), Table 17, Integrated Interface Blocks for PCI Express Designs, and Integrated Block for Interlaken, and Memory Interfaces.		

Date	Version	Description of Revisions
02/06/2014	1.1	Updated PCIe information in Table 1 and Table 3. Added FFVJ1924 package to Table 8.
12/10/2013	1.0	Initial Xilinx release.
