### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### Details

|                                |   |
|--------------------------------|---|
| Product Status                 | Active  |
| Number of LABs/CLBs            | 147780  |
| Number of Logic Elements/Cells | 2586150   |
| Total RAM Bits                 | 391168000   |
| Number of I/O                  | 448   |
| Number of Gates                | -   |
| Voltage - Supply               | 0.825V ~ 0.876V   |
| Mounting Type                  | Surface Mount   |
| Operating Temperature          | -40°C ~ 100°C (TJ)  |
| Package / Case                 | 2577-BBGA, FCBGA  |
| Supplier Device Package        | 2577-FCBGA (52.5x52.5)  |
| Purchase URL                   | <a href="https://www.e-xfl.com/product-detail/xilinx/xcvu9p-2flga2577i">https://www.e-xfl.com/product-detail/xilinx/xcvu9p-2flga2577i</a> |

# Summary of Features

## Processing System Overview

UltraScale+ MPSoCs feature dual and quad core variants of the ARM Cortex-A53 (APU) with dual-core ARM Cortex-R5 (RPU) processing system (PS). Some devices also include a dedicated ARM Mali™-400 MP2 graphics processing unit (GPU). See [Table 2](#).

*Table 2: Zynq UltraScale+ MPSoC Device Features*

|     | CG Devices               | EG Devices               | EV Devices               |
|-----|--------------------------|--------------------------|--------------------------|
| APU | Dual-core ARM Cortex-A53 | Quad-core ARM Cortex-A53 | Quad-core ARM Cortex-A53 |
| RPU | Dual-core ARM Cortex-R5  | Dual-core ARM Cortex-R5  | Dual-core ARM Cortex-R5  |
| GPU | –                        | Mali-400MP2              | Mali-400MP2              |
| VCU | –                        | –                        | H.264/H.265              |

To support the processors' functionality, a number of peripherals with dedicated functions are included in the PS. For interfacing to external memories for data or configuration storage, the PS includes a multi-protocol dynamic memory controller, a DMA controller, a NAND controller, an SD/eMMC controller and a Quad SPI controller. In addition to interfacing to external memories, the APU also includes a Level-1 (L1) and Level-2 (L2) cache hierarchy; the RPU includes an L1 cache and Tightly Coupled memory subsystem. Each has access to a 256KB on-chip memory.

For high-speed interfacing, the PS includes 4 channels of transmit (TX) and receive (RX) pairs of transceivers, called PS-GTR transceivers, supporting data rates of up to 6.0Gb/s. These transceivers can interface to the high-speed peripheral blocks to support PCIe Gen2 root complex or end point in x1, x2, or x4 configurations; Serial-ATA (SATA) at 1.5Gb/s, 3.0Gb/s, or 6.0Gb/s data rates; and up to two lanes of Display Port at 1.62Gb/s, 2.7Gb/s, or 5.4Gb/s data rates. The PS-GTR transceivers can also interface to components over USB 3.0 and Serial Gigabit Media Independent Interface (SGMII).

For general connectivity, the PS includes: a pair of USB 2.0 controllers, which can be configured as host, device, or On-The-Go (OTG); an I2C controller; a UART; and a CAN2.0B controller that conforms to ISO11898-1. There are also four triple speed Ethernet MACs and 128 bits of GPIO, of which 78 bits are available through the MIO and 96 through the EMIO.

High-bandwidth connectivity based on the ARM AMBA® AXI4 protocol connects the processing units with the peripherals and provides interface between the PS and the programmable logic (PL).

## Notes:

1. Certain advanced configuration features are not supported in the KU025. Refer to the [Configuring FPGAs](#) section for details.
2. HP = High-performance I/O with support for I/O voltage from 1.0V to 1.8V.
3. HR = High-range I/O with support for I/O voltage from 1.2V to 3.3V.
4. GTH transceivers in SF/FB packages support data rates up to 12.5Gb/s. See [Table 4](#).
5. GTY transceivers in Kintex UltraScale devices support data rates up to 16.3Gb/s. See [Table 4](#).

## Notes:

- Go to [Ordering Information](#) for package designation details.
- FB/FF/FL packages have 1.0mm ball pitch. SF packages have 0.8mm ball pitch.
- Packages with the same last letter and number sequence, e.g., A2104, are footprint compatible with all other UltraScale architecture-based devices with the same sequence. The footprint compatible devices within this family are outlined. See the [UltraScale Architecture Product Selection Guide](#) for details on inter-family migration.
- GTY transceivers in Kintex UltraScale devices support data rates up to 16.3Gb/s.
- GTH transceivers in SF/FB packages support data rates up to 12.5Gb/s.

## Notes:

1. HP = High-performance I/O with support for I/O voltage from 1.0V to 1.8V.
2. HD = High-density I/O with support for I/O voltage from 1.2V to 3.3V.
3. GTY transceiver line rates are package limited: SFVB784 to 12.5Gb/s; FFVA676, FFVD900, and FFVA1156 to 16.3Gb/s. See [Table 6](#).

## Notes:

1. Go to [Ordering Information](#) for package designation details.
2. FF packages have 1.0mm ball pitch. SF packages have 0.8mm ball pitch.
3. GTY transceiver line rates are package limited: SFVB784 to 12.5Gb/s; FFVA676, FFVD900, and FFVA1156 to 16.3Gb/s.
4. Packages with the same last letter and number sequence, e.g., A676, are footprint compatible with all other UltraScale architecture-based devices with the same sequence. The footprint compatible devices within this family are outlined. See the [UltraScale Architecture Product Selection Guide](#) for details on inter-family migration.

## Notes:

1. Go to [Ordering Information](#) for package designation details.
2. FB/FF packages have 1.0mm ball pitch. SB/SF packages have 0.8mm ball pitch.
3. All device package combinations bond out 4 PS-GTR transceivers.
4. All device package combinations bond out 214 PS I/O except ZU2CG and ZU3CG in the SBVA484 and SFVA625 packages, which bond out 170 PS I/Os.
5. Packages with the same last letter and number sequence, e.g., A484, are footprint compatible with all other UltraScale architecture-based devices with the same sequence. The footprint compatible devices within this family are outlined.
6. All 58 HP I/O pins are powered by the same  $V_{CCO}$  supply.
7. GTH transceivers in the SFVC784 package support data rates up to 12.5Gb/s.

## Notes:

- Go to [Ordering Information](#) for package designation details.
- FB/FF packages have 1.0mm ball pitch. SB/SF packages have 0.8mm ball pitch.
- All device package combinations bond out 4 PS-GTR transceivers.
- All device package combinations bond out 214 PS I/O except ZU2EG and ZU3EG in the SBVA484 and SFVA625 packages, which bond out 170 PS I/Os.
- Packages with the same last letter and number sequence, e.g., A484, are footprint compatible with all other UltraScale architecture-based devices with the same sequence. The footprint compatible devices within this family are outlined.
- All 58 HP I/O pins are powered by the same V<sub>CCO</sub> supply.
- GTH transceivers in the SFVC784 package support data rates up to 12.5Gb/s.

# Zynq UltraScale+: EG Device Feature Summary

Table 15: Zynq UltraScale+: EV Device Feature Summary

|   | ZU4EV   | ZU5EV   | ZU7EV   |
|---|---|---------|---------|
| Application Processing Unit             | Quad-core ARM Cortex-A53 MPCore with CoreSight; NEON & Single/Double Precision Floating Point; 32KB/32KB L1 Cache, 1MB L2 Cache |         |         |
| Real-Time Processing Unit               | Dual-core ARM Cortex-R5 with CoreSight; Single/Double Precision Floating Point; 32KB/32KB L1 Cache, and TCM                     |         |         |
| Embedded and External Memory            | 256KB On-Chip Memory w/ECC; External DDR4; DDR3; DDR3L; LPDDR4; LPDDR3; External Quad-SPI; NAND; eMMC                           |         |         |

## Notes:

1. HP = High-performance I/O with support for I/O voltage from 1.0V to 1.8V.
2. HD = High-density I/O with support for I/O voltage from 1.2V to 3.3V.
3. GTH transceivers in the SFVC784 package support data rates up to 12.5Gb/s. See [Table 16](#).

## I/O Electrical Characteristics

Single-ended outputs use a conventional CMOS push/pull output structure driving High towards  $V_{CCO}$  or Low towards ground, and can be put into a high-Z state. The system designer can specify the slew rate and the output strength. The input is always active but is usually ignored while the output is active. Each pin can optionally have a weak pull-up or a weak pull-down resistor.

Most signal pin pairs can be configured as differential input pairs or output pairs. Differential input pin pairs can optionally be terminated with a 100 $\Omega$  internal resistor. All UltraScale devices support differential standards beyond LVDS, including RSDS, BLVDS, differential SSTL, and differential HSTL. Each of the I/Os supports memory I/O standards, such as single-ended and differential HSTL as well as single-ended and differential SSTL. UltraScale+ families add support for MIPI with a dedicated D-PHY in the I/O bank.

### ***3-State Digitally Controlled Impedance and Low Power I/O Features***

The 3-state Digitally Controlled Impedance (T\_DCI) can control the output drive impedance (series termination) or can provide parallel termination of an input signal to  $V_{CCO}$  or split (Thevenin) termination to  $V_{CCO}/2$ . This allows users to eliminate off-chip termination for signals using T\_DCI. In addition to board space savings, the termination automatically turns off when in output mode or when 3-stated, saving considerable power compared to off-chip termination. The I/Os also have low power modes for IBUF and IDELAY to provide further power savings, especially when used to implement memory interfaces.

## I/O Logic

### ***Input and Output Delay***

All inputs and outputs can be configured as either combinatorial or registered. Double data rate (DDR) is supported by all inputs and outputs. Any input or output can be individually delayed by up to 1,250ps of delay with a resolution of 5–15ps. Such delays are implemented as IDELAY and ODELAY. The number of delay steps can be set by configuration and can also be incremented or decremented while in use. The IDELAY and ODELAY can be cascaded together to double the amount of delay in a single direction.

### ***ISERDES and OSERDES***

Many applications combine high-speed, bit-serial I/O with slower parallel operation inside the device. This requires a serializer and deserializer (SerDes) inside the I/O logic. Each I/O pin possesses an IOSERDES (ISERDES and OSERDES) capable of performing serial-to-parallel or parallel-to-serial conversions with programmable widths of 2, 4, or 8 bits. These I/O logic features enable high-performance interfaces, such as Gigabit Ethernet/1000BaseX/SGMII, to be moved from the transceivers to the SelectIO interface.

# High-Speed Serial Transceivers

Serial data transmission between devices on the same PCB, over backplanes, and across even longer distances is becoming increasingly important for scaling to 100Gb/s and 400Gb/s line cards. Specialized dedicated on-chip circuitry and differential I/O capable of coping with the signal integrity issues are required at these high data rates.

Three types of transceivers are used in the UltraScale architecture: GTH and GTY in FPGAs and MPSoC PL, and PS-GTR in the MPSoC PS. All transceivers are arranged in groups of four, known as a transceiver Quad. Each serial transceiver is a combined transmitter and receiver. [Table 17](#) compares the available transceivers.

**Table 17: Transceiver Information**

|                | Kintex UltraScale   |   | Kintex UltraScale+  |   | Virtex UltraScale   |   | Virtex UltraScale+  | Zynq UltraScale+   |   |   |

The following information in this section pertains to the GTH and GTY only.

The serial transmitter and receiver are independent circuits that use an advanced phase-locked loop (PLL) architecture to multiply the reference frequency input by certain programmable numbers between 4 and 25 to become the bit-serial data clock. Each transceiver has a large number of user-definable features and parameters. All of these can be defined during device configuration, and many can also be modified during operation.

## Transmitter

The transmitter is fundamentally a parallel-to-serial converter with a conversion ratio of 16, 20, 32, 40, 64, or 80 for the GTH and 16, 20, 32, 40, 64, 80, 128, or 160 for the GTY. This allows the designer to trade off datapath width against timing margin in high-performance designs. These transmitter outputs drive the PC board with a single-channel differential output signal. TXOUTCLK is the appropriately divided serial data clock and can be used directly to register the parallel data coming from the internal logic. The incoming parallel data is fed through an optional FIFO and has additional hardware support for the 8B/10B, 64B/66B, or 64B/67B encoding schemes to provide a sufficient number of transitions. The bit-serial output signal drives two package pins with differential signals. This output signal pair has programmable signal swing as well as programmable pre- and post-emphasis to compensate for PC board losses and other interconnect characteristics. For shorter channels, the swing can be reduced to reduce power consumption.

## Receiver

The receiver is fundamentally a serial-to-parallel converter, changing the incoming bit-serial differential signal into a parallel stream of words, each 16, 20, 32, 40, 64, or 80 bits in the GTH or 16, 20, 32, 40, 64, 80, 128, or 160 for the GTY. This allows the designer to trade off internal datapath width against logic timing margin. The receiver takes the incoming differential data stream, feeds it through programmable DC automatic gain control, linear and decision feedback equalizers (to compensate for PC board, cable, optical and other interconnect characteristics), and uses the reference clock input to initiate clock recognition. There is no need for a separate clock line. The data pattern uses non-return-to-zero (NRZ) encoding and optionally ensures sufficient data transitions by using the selected encoding scheme. Parallel data is then transferred into the device logic using the RXUSRCLK clock. For short channels, the transceivers offer a special low-power mode (LPM) to reduce power consumption by approximately 30%. The receiver DC automatic gain control and linear and decision feedback equalizers can optionally “auto-adapt” to automatically learn and compensate for different interconnect characteristics. This enables even more margin for 10G+ and 25G+ backplanes.

## Out-of-Band Signaling

The transceivers provide out-of-band (OOB) signaling, often used to send low-speed signals from the transmitter to the receiver while high-speed serial data transmission is not active. This is typically done when the link is in a powered-down state or has not yet been initialized. This benefits PCIe and SATA/SAS and QPI applications.

## Integrated Interface Blocks for PCI Express Designs

The UltraScale architecture includes integrated blocks for PCIe technology that can be configured as an Endpoint or Root Port. UltraScale devices are compliant to the PCI Express Base Specification Revision 3.0. UltraScale+ devices are compliant to the PCI Express Base Specification Revision 3.1 for Gen3 and lower data rates, and compatible with the PCI Express Base Specification Revision 4.0 (rev 0.5) for Gen4 data rates.

The Root Port can be used to build the basis for a compatible Root Complex, to allow custom chip-to-chip communication via the PCI Express protocol, and to attach ASSP Endpoint devices, such as Ethernet Controllers or Fibre Channel HBAs, to the FPGA or MPSoC.

This block is highly configurable to system design requirements and can operate up to the maximum lane widths and data rates listed in [Table 18](#).

*Table 18: PCIe Maximum Configurations*

|                              | Kintex<br>UltraScale | Kintex<br>UltraScale+ | Virtex<br>UltraScale | Virtex<br>UltraScale+ | Zynq<br>UltraScale+ |
|------------------------------|----------------------|-----------------------|----------------------|-----------------------|---------------------|
| Gen1 (2.5Gb/s)               | x8                   | x16                   | x8                   | x16                   | x16                 |
| Gen2 (5Gb/s)                 | x8                   | x16                   | x8                   | x16                   | x16                 |
| Gen3 (8Gb/s)                 | x8                   | x16                   | x8                   | x16                   | x16                 |
| Gen4 (16Gb/s) <sup>(1)</sup> |                      | x8                    |                      | x8                    | x8                  |

**Notes:**

1. Transceivers in Kintex UltraScale and Virtex UltraScale devices are capable of operating at Gen4 data rates.

For high-performance applications, advanced buffering techniques of the block offer a flexible maximum payload size of up to 1,024 bytes. The integrated block interfaces to the integrated high-speed transceivers for serial connectivity and to block RAMs for data buffering. Combined, these elements implement the Physical Layer, Data Link Layer, and Transaction Layer of the PCI Express protocol.

Xilinx provides a light-weight, configurable, easy-to-use LogiCORE™ IP wrapper that ties the various building blocks (the integrated block for PCIe, the transceivers, block RAM, and clocking resources) into an Endpoint or Root Port solution. The system designer has control over many configurable parameters: link width and speed, maximum payload size, FPGA or MPSoC logic interface speeds, reference clock frequency, and base address register decoding and filtering.

---

## UltraRAM

UltraRAM is a high-density, dual-port, synchronous memory block available in UltraScale+ devices. Both of the ports share the same clock and can address all of the 4K x 72 bits. Each port can independently read from or write to the memory array. UltraRAM supports two types of write enable schemes. The first mode is consistent with the block RAM byte write enable mode. The second mode allows gating the data and parity byte writes separately. UltraRAM blocks can be connected together to create larger memory arrays. Dedicated routing in the UltraRAM column enables the entire column height to be connected together. If additional density is required, all the UltraRAM columns in an SLR can be connected together with a few fabric resources to create single instances of RAM approximately 100Mb in size. This makes UltraRAM an ideal solution for replacing external memories such as SRAM. Cascadable anywhere from 288Kb to 100Mb, UltraRAM provides the flexibility to fulfill many different memory requirements.

## Error Detection and Correction

Each 64-bit-wide UltraRAM can generate, store and utilize eight additional Hamming code bits and perform single-bit error correction and double-bit error detection (ECC) during the read process.

---

## High Bandwidth Memory (HBM)

Virtex UltraScale+ HBM devices incorporate 4GB HBM stacks adjacent to the FPGA die. Using stacked silicon interconnect technology, the FPGA communicates to the HBM stacks through memory controllers that connect to dedicated low-inductance interconnect in the silicon interposer. Each Virtex UltraScale+ HBM FPGA contains one or two HBM stacks, resulting in up to 8GB of HBM per FPGA.

The FPGA has 32 HBM AXI interfaces used to communicate with the HBM. Through a built-in switch mechanism, any of the 32 HBM AXI interfaces can access any memory address on either one or both of the HBM stacks due to the flexible addressing feature. This flexible connection between the FPGA and the HBM stacks results in easy floorplanning and timing closure. The memory controllers perform read and write reordering to improve bus efficiency. Data integrity is ensured through error checking and correction (ECC) circuitry.

---

## Configurable Logic Block

Every Configurable Logic Block (CLB) in the UltraScale architecture contains 8 LUTs and 16 flip-flops. The LUTs can be configured as either one 6-input LUT with one output, or as two 5-input LUTs with separate outputs but common inputs. Each LUT can optionally be registered in a flip-flop. In addition to the LUTs and flip-flops, the CLB contains arithmetic carry logic and multiplexers to create wider logic functions.

Each CLB contains one slice. There are two types of slices: SLICEL and SLICEM. LUTs in the SLICEM can be configured as 64-bit RAM, as 32-bit shift registers (SRL32), or as two SRL16s. CLBs in the UltraScale architecture have increased routing and connectivity compared to CLBs in previous-generation Xilinx devices. They also have additional control signals to enable superior register packing, resulting in overall higher device utilization.

---

## Interconnect

Various length vertical and horizontal routing resources in the UltraScale architecture that span 1, 2, 4, 5, 12, or 16 CLBs ensure that all signals can be transported from source to destination with ease, providing support for the next generation of wide data buses to be routed across even the highest capacity devices while simultaneously improving quality of results and software run time.

---

## Digital Signal Processing

DSP applications use many binary multipliers and accumulators, best implemented in dedicated DSP slices. All UltraScale devices have many dedicated, low-power DSP slices, combining high speed with small size while retaining system design flexibility.

Each DSP slice fundamentally consists of a dedicated  $27 \times 18$  bit twos complement multiplier and a 48-bit accumulator. The multiplier can be dynamically bypassed, and two 48-bit inputs can feed a single-instruction-multiple-data (SIMD) arithmetic unit (dual 24-bit add/subtract/accumulate or quad 12-bit add/subtract/accumulate), or a logic unit that can generate any one of ten different logic functions of the two operands.

The DSP includes an additional pre-adder, typically used in symmetrical filters. This pre-adder improves performance in densely packed designs and reduces the DSP slice count by up to 50%. The 96-bit-wide XOR function, programmable to 12, 24, 48, or 96-bit widths, enables performance improvements when implementing forward error correction and cyclic redundancy checking algorithms.

The DSP also includes a 48-bit-wide pattern detector that can be used for convergent or symmetric rounding. The pattern detector is also capable of implementing 96-bit-wide logic functions when used in conjunction with the logic unit.

The DSP slice provides extensive pipelining and extension capabilities that enhance the speed and efficiency of many applications beyond digital signal processing, such as wide dynamic bus shifters, memory address generators, wide bus multiplexers, and memory-mapped I/O register files. The accumulator can also be used as a synchronous up/down counter.

---

## System Monitor

The System Monitor blocks in the UltraScale architecture are used to enhance the overall safety, security, and reliability of the system by monitoring the physical environment via on-chip power supply and temperature sensors and external channels to the ADC.

All UltraScale architecture-based devices contain at least one System Monitor. The System Monitor in UltraScale+ FPGAs and the PL of Zynq UltraScale+ MPSoCs is similar to the Kintex UltraScale and Virtex UltraScale devices but with additional features including a PMBus interface.

Zynq UltraScale+ MPSoCs contain an additional System Monitor block in the PS. See [Table 20](#).

**Table 20: Key System Monitor Features**

|            | Kintex UltraScale<br>Virtex UltraScale | Kintex UltraScale+<br>Virtex UltraScale+<br>Zynq UltraScale+ MPSoC PL | Zynq UltraScale+ MPSoC PS |
|------------|--|---|---------------------------|
| ADC        | 10-bit 200kSPS                         | 10-bit 200kSPS  | 10-bit 1MSPS              |
| Interfaces | JTAG, I2C, DRP                         | JTAG, I2C, DRP, PMBus   | APB                       |

In FPGAs and the MPSoC PL, sensor outputs and up to 17 user-allocated external analog inputs are digitized using a 10-bit 200 kilo-sample-per-second (kSPS) ADC, and the measurements are stored in registers that can be accessed via internal FPGA (DRP), JTAG, PMBus, or I2C interfaces. The I2C interface and PMBus allow the on-chip monitoring to be easily accessed by the System Manager/Host before and after device configuration.

The System Monitor in the MPSoC PS uses a 10-bit, 1 mega-sample-per-second (MSPS) ADC to digitize the sensor outputs. The measurements are stored in registers and are accessed via the Advanced Peripheral Bus (APB) interface by the processors and the platform management unit (PMU) in the PS.

## Configuration

The UltraScale architecture-based devices store their customized configuration in SRAM-type internal latches. The configuration storage is volatile and must be reloaded whenever the device is powered up. This storage can also be reloaded at any time. Several methods and data formats for loading configuration are available, determined by the mode pins, with more dedicated configuration datapath pins to simplify the configuration process.

UltraScale architecture-based devices support secure and non-secure boot with optional Advanced Encryption Standard - Galois/Counter Mode (AES-GCM) decryption and authentication logic. If only authentication is required, the UltraScale architecture provides an alternative form of authentication in the form of RSA algorithms. For RSA authentication support in the Kintex UltraScale and Virtex UltraScale families, go to [UG570](#), *UltraScale Architecture Configuration User Guide*.

UltraScale architecture-based devices also have the ability to select between multiple configurations, and support robust field-update methodologies. This is especially useful for updates to a design after the end product has been shipped. Designers can release their product with an early version of the design, thus getting their product to market faster. This feature allows designers to keep their customers current with the most up-to-date design while the product is already deployed in the field.

## Booting MPSoCs

Zynq UltraScale+ MPSoCs use a multi-stage boot process that supports both a non-secure and a secure boot. The PS is the master of the boot and configuration process. For a secure boot, the AES-GCM, SHA-3/384 decryption/authentication, and 4096-bit RSA blocks decrypt and authenticate the image.

Upon reset, the device mode pins are read to determine the primary boot device to be used: NAND, Quad-SPI, SD, eMMC, or JTAG. JTAG can only be used as a non-secure boot source and is intended for debugging purposes. One of the CPUs, Cortex-A53 or Cortex-R5, executes code out of on-chip ROM and copies the first stage boot loader (FSBL) from the boot device to the on-chip memory (OCM).

After copying the FSBL to OCM, the processor executes the FSBL. Xilinx supplies example FSBLs or users can create their own. The FSBL initiates the boot of the PS and can load and configure the PL, or configuration of the PL can be deferred to a later stage. The FSBL typically loads either a user application or an optional second stage boot loader (SSBL) such as U-Boot. Users obtain example SSBL from Xilinx or a third party, or they can create their own SSBL. The SSBL continues the boot process by loading code from any of the primary boot devices or from other sources such as USB, Ethernet, etc. If the FSBL did not configure the PL, the SSBL can do so, or again, the configuration can be deferred to a later stage.

The static memory interface controller (NAND, eMMC, or Quad-SPI) is configured using default settings. To improve device configuration speed, these settings can be modified by information provided in the boot image header. The ROM boot image is not user readable or executable after boot.

## Configuring FPGAs

The SPI (serial NOR) interface (x1, x2, x4, and dual x4 modes) and the BPI (parallel NOR) interface (x8 and x16 modes) are two common methods used for configuring the FPGA. Users can directly connect an SPI or BPI flash to the FPGA, and the FPGA's internal configuration logic reads the bitstream out of the flash and configures itself, eliminating the need for an external controller. The FPGA automatically detects the bus width on the fly, eliminating the need for any external controls or switches. Bus widths supported are x1, x2, x4, and dual x4 for SPI, and x8 and x16 for BPI. The larger bus widths increase configuration speed and reduce the amount of time it takes for the FPGA to start up after power-on.

In master mode, the FPGA can drive the configuration clock from an internally generated clock, or for higher speed configuration, the FPGA can use an external configuration clock source. This allows high-speed configuration with the ease of use characteristic of master mode. Slave modes up to 32 bits wide that are especially useful for processor-driven configuration are also supported by the FPGA. In addition, the new media configuration access port (MCAP) provides a direct connection between the integrated block for PCIe and the configuration logic to simplify configuration over PCIe.

SEU detection and mitigation (SEM) IP, RSA authentication, post-configuration CRC, and Security Monitor (SecMon) IP are not supported in the KU025 FPGA.

---

## Packaging

The UltraScale devices are available in a variety of organic flip-chip and lidless flip-chip packages supporting different quantities of I/Os and transceivers. Maximum supported performance can depend on the style of package and its material. Always refer to the specific device data sheet for performance specifications by package type.

In flip-chip packages, the silicon device is attached to the package substrate using a high-performance flip-chip process. Decoupling capacitors are mounted on the package substrate to optimize signal integrity under simultaneous switching of outputs (SSO) conditions.

# Ordering Information

Table 21 shows the speed and temperature grades available in the different device families.  $V_{CCINT}$  supply voltage is listed in parentheses.

Table 21: Speed Grade and Temperature Grade

| Device Family      | Devices  | Speed Grade and Temperature Grade |                           |                                      |                                      |
|--------------------|--|-----------------------------------|---------------------------|--------------------------------------|--------------------------------------|
|                    |  | Commercial (C)                    | Extended (E)              |                                      | Industrial (I)                       |
|                    |  | 0°C to +85°C                      | 0°C to +100°C             | 0°C to +110°C                        | –40°C to +100°C                      |
| Kintex UltraScale  | All  |                                   | -3E <sup>(1)</sup> (1.0V) |                                      |                                      |
|                    |  |                                   | -2E (0.95V)               |                                      | -2I (0.95V)                          |
|                    |  | -1C (0.95V)                       |                           |                                      | -1I (0.95V)                          |
|                    |  |                                   |                           |                                      | -1LI <sup>(1)</sup> (0.95V or 0.90V) |

The ordering information shown in [Figure 3](#) applies to all packages in the Kintex UltraScale and Virtex UltraScale FPGAs. Refer to the Package Marking section of [UG575, UltraScale and UltraScale+ FPGAs Packaging and Pinouts User Guide](#) for a more detailed explanation of the device markings.

**Figure 3: Kintex UltraScale and Virtex UltraScale FPGA Ordering Information**

# Revision History

The following table shows the revision history for this document:

| Date       | Version | Description of Revisions   |
|------------|---------|--|
| 02/15/2017 | 2.11    | Updated <a href="#">Table 1</a> , <a href="#">Table 9</a> : Converted HBM from Gb to GB. Updated <a href="#">Table 11</a> , <a href="#">Table 13</a> , and <a href="#">Table 15</a> : Updated DSP count for Zynq UltraScale+ MPSoCs. Updated <a href="#">Cache Coherent Interconnect for Accelerators (CCIX)</a> . Updated <a href="#">High Bandwidth Memory (HBM)</a> . Updated <a href="#">Table 21</a> : Added -2E speed grade to all UltraScale+ devices. Removed -3E from XCZU2 and XCZU3.  |
| 11/09/2016 | 2.10    | Updated <a href="#">Table 1</a> . Added HBM devices to <a href="#">Table 9</a> , <a href="#">Table 10</a> , <a href="#">Table 19</a> and new <a href="#">High Bandwidth Memory (HBM)</a> section. Added <a href="#">Cache Coherent Interconnect for Accelerators (CCIX)</a> section.   |
| 09/27/2016 | 2.9     | Updated <a href="#">Table 5</a> , <a href="#">Table 12</a> , <a href="#">Table 13</a> , and <a href="#">Table 14</a> .   |
| 06/03/2016 | 2.8     | Added Zynq UltraScale+ MPSoC CG devices: Added <a href="#">Table 2</a> . Updated <a href="#">Table 11</a> , <a href="#">Table 12</a> , <a href="#">Table 21</a> , and <a href="#">Figure 5</a> . Created separate tables for EG and EV devices: <a href="#">Table 13</a> , <a href="#">Table 14</a> , <a href="#">Table 15</a> , and <a href="#">Table 16</a> .<br>Updated <a href="#">Table 1</a> , <a href="#">Table 3</a> , <a href="#">Table 5</a> and notes, <a href="#">Table 6</a> and notes, <a href="#">Table 7</a> , <a href="#">Table 9</a> , <a href="#">Table 10</a> , <a href="#">Processing System Overview</a> , and <a href="#">Processing System (PS)</a> details. |
| 02/17/2016 | 2.7     | Added <a href="#">Migrating Devices</a> . Updated <a href="#">Table 4</a> , <a href="#">Table 5</a> , <a href="#">Table 6</a> , <a href="#">Table 10</a> , <a href="#">Table 11</a> , <a href="#">Table 12</a> , and <a href="#">Figure 4</a> .  |
| 12/15/2015 | 2.6     | Updated <a href="#">Table 1</a> , <a href="#">Table 5</a> , <a href="#">Table 6</a> , <a href="#">Table 9</a> , <a href="#">Table 12</a> , and <a href="#">Configuration</a> .   |
| 11/24/2015 | 2.5     | Updated <a href="#">Configuration, Encryption, and System Monitoring</a> , <a href="#">Table 5</a> , <a href="#">Table 9</a> , <a href="#">Table 11</a> , and <a href="#">Table 21</a> .   |
| 10/15/2015 | 2.4     | Updated <a href="#">Table 1</a> , <a href="#">Table 3</a> , <a href="#">Table 5</a> , <a href="#">Table 7</a> , <a href="#">Table 9</a> , and <a href="#">Table 11</a> with System Logic Cells. Updated <a href="#">Figure 3</a> . Updated <a href="#">Table 19</a> .  |
| 09/29/2015 | 2.3     | Added A1156 to KU095 in <a href="#">Table 4</a> . Updated <a href="#">Table 5</a> . Updated Max. Distributed RAM in <a href="#">Table 9</a> . Updated Distributed RAM in <a href="#">Table 11</a> . Added <a href="#">Table 19</a> . Updated <a href="#">Table 21</a> . Updated <a href="#">Figure 3</a> .   |
| 08/14/2015 | 2.2     | Updated <a href="#">Table 1</a> . Added XCKU025 to <a href="#">Table 3</a> , <a href="#">Table 4</a> , and <a href="#">Table 21</a> . Updated <a href="#">Table 7</a> , <a href="#">Table 9</a> , <a href="#">Table 11</a> , <a href="#">Table 12</a> , <a href="#">Table 18</a> . Updated <a href="#">System Monitor</a> . Added voltage information to <a href="#">Table 21</a> .  |
| 04/27/2015 | 2.1     | Updated <a href="#">Table 1</a> , <a href="#">Table 3</a> , <a href="#">Table 4</a> , <a href="#">Table 5</a> , <a href="#">Table 6</a> , <a href="#">Table 7</a> , <a href="#">Table 10</a> , <a href="#">Table 11</a> , <a href="#">Table 12</a> , <a href="#">Table 17</a> , I/O, Transceiver, PCIe, 100G Ethernet, and 150G Interlaken, <a href="#">Integrated Interface Blocks for PCI Express Designs</a> , USB 3.0/2.0, Clock Management, System Monitor, and <a href="#">Figure 3</a> .  |
| 02/23/2015 | 2.0     | UltraScale+ device information (Kintex UltraScale+ FPGA, Virtex UltraScale+ FPGA, and Zynq UltraScale+ MPSoC) added throughout document.   |
| 12/16/2014 | 1.6     | Updated <a href="#">Table 1</a> ; I/O, Transceiver, PCIe, 100G Ethernet, and 150G Interlaken; <a href="#">Table 3</a> , <a href="#">Table 7</a> ; <a href="#">Table 8</a> ; and <a href="#">Table 17</a> .   |
| 11/17/2014 | 1.5     | Updated I/O, Transceiver, PCIe, 100G Ethernet, and 150G Interlaken; <a href="#">Table 1</a> ; <a href="#">Table 4</a> ; <a href="#">Table 7</a> ; <a href="#">Table 8</a> ; <a href="#">Table 17</a> ; <a href="#">Input/Output</a> ; and <a href="#">Figure 3</a> .   |
| 09/16/2014 | 1.4     | Updated Logic Cell information in <a href="#">Table 1</a> . Updated <a href="#">Table 3</a> ; I/O, Transceiver, PCIe, 100G Ethernet, and 150G Interlaken; <a href="#">Table 7</a> ; <a href="#">Table 8</a> ; <a href="#">Integrated Block for 100G Ethernet</a> ; and <a href="#">Figure 3</a> .  |
| 05/20/2014 | 1.3     | Updated <a href="#">Table 8</a> .  |
| 05/13/2014 | 1.2     | Added <a href="#">Ordering Information</a> . Updated <a href="#">Table 1</a> , <a href="#">Clocks and Memory Interfaces</a> , <a href="#">Table 3</a> , <a href="#">Table 7</a> (removed XCVU145; added XCVU190), <a href="#">Table 8</a> (removed XCVU145; removed FLVD1924 from XCVU160; added XCVU190; updated Table Notes), <a href="#">Table 17</a> , <a href="#">Integrated Interface Blocks for PCI Express Designs</a> , and <a href="#">Integrated Block for Interlaken</a> , and <a href="#">Memory Interfaces</a> .   |

## Automotive Applications Disclaimer

AUTOMOTIVE PRODUCTS (IDENTIFIED AS "XA" IN THE PART NUMBER) ARE NOT WARRANTED FOR USE IN THE DEPLOYMENT OF AIRBAGS OR FOR USE IN APPLICATIONS THAT AFFECT CONTROL OF A VEHICLE ("SAFETY APPLICATION") UNLESS THERE IS A SAFETY CONCEPT OR REDUNDANCY FEATURE CONSISTENT WITH THE ISO 26262 AUTOMOTIVE SAFETY STANDARD ("SAFETY DESIGN"). CUSTOMER SHALL, PRIOR TO USING OR DISTRIBUTING ANY SYSTEMS THAT INCORPORATE PRODUCTS, THOROUGHLY TEST SUCH SYSTEMS FOR SAFETY PURPOSES. USE OF PRODUCTS IN A SAFETY APPLICATION WITHOUT A SAFETY DESIGN IS FULLY AT THE RISK OF CUSTOMER, SUBJECT ONLY TO APPLICABLE LAWS AND REGULATIONS GOVERNING LIMITATIONS ON PRODUCT LIABILITY.
