Understanding Embedded - Microprocessors

Embedded microprocessors are specialized computing chips designed to perform specific tasks within an embedded system. Unlike general-purpose microprocessors found in personal computers, embedded microprocessors are tailored for dedicated functions within larger systems, offering optimized performance, efficiency, and reliability. These microprocessors are integral to the operation of countless electronic devices, providing the computational power necessary for controlling processes, handling data, and managing communications.

Applications of Embedded - Microprocessors

Embedded microprocessors are utilized across a broad spectrum of applications, making them indispensable in

1.1 Features

To support a wide variety of applications, the processor offers a robust array of features, including the following:

- ARM920T™ Microprocessor Core
- AHB to IP Bus Interfaces (AIPIs)
- External Interface Module (EIM)
- SDRAM Controller (SDRAMC)
- DPLL Clock and Power Control Module
- Three Universal Asynchronous Receiver/Transmitters (UART 1, UART 2, and UART3)
- Two Serial Peripheral Interfaces (SPI1 and SPI2)
- Two General-Purpose 32-bit Counters/Timers
- Watchdog Timer
- Real-Time Clock/Sampling Timer (RTC)
- LCD Controller (LCDC)
- Pulse-Width Modulation (PWM) Module
- Universal Serial Bus (USB) Device
- Multimedia Card and Secure Digital (MMC/SD) Host Controller Module
- Memory Stick® Host Controller (MSHC)
- Direct Memory Access Controller (DMAC)
- Two Synchronous Serial Interfaces and an Inter-IC Sound (SSI1 and SSI2/I^2S) Module
- Inter-IC (I^2C) Bus Module
- Video Port

- General-Purpose I/O (GPIO) Ports
- Bootstrap Mode
- Analog Signal Processing (ASP) Module
- Bluetooth™ Accelerator (BTA)
- Multimedia Accelerator (MMA)
- Power Management Features
- Operating Voltage Range: 1.7 V to 1.9 V core, 1.7 V to 3.3 V I/O
- 256-pin MAPBGA Package

1.2 Target Applications

The i.MX1 processor is targeted for advanced information appliances, smart phones, Web browsers, based on the popular Palm OS platform, and messaging applications such as wireless cellular products, including the Accompli^{TM} 008 GSM/GPRS interactive communicator.

1.3 Ordering Information

Table 1 provides ordering information.

1.4 Conventions

This document uses the following conventions:

- $\overline{\text{OVERBAR}}$ is used to indicate a signal that is active when pulled low: for example, $\overline{\text{RESET}}$.
- *Logic level one* is a voltage that corresponds to Boolean true (1) state.
- *Logic level zero* is a voltage that corresponds to Boolean false (0) state.
- To *set* a bit or bits means to establish logic level one.
- To *clear* a bit or bits means to establish logic level zero.
- A *signal* is an electronic construct whose state conveys or changes in state convey information.
- A *pin* is an external physical connection. The same pin can be used to connect a number of signals.
- *Asserted* means that a discrete signal is in active logic state.
  - *Active low* signals change from logic level one to logic level zero.
  - *Active high* signals change from logic level zero to logic level one.

Table 2. i.MX1 Signal Descriptions (Continued)

Signal Name	Function/Notes
SDIBA [3:0]	SDRAM interleave addressing mode bank address multiplexed with address signals A [19:16]. These signals are logically equivalent to core address p_addr [12:9] in SDRAM cycles.
MA [11:10]	SDRAM address signals
MA [9:0]	SDRAM address signals which are multiplexed with address signals A [10:1]. MA [9:0] are selected on SDRAM cycles.
DQM [3:0]	SDRAM data enable
$\overline{\text{CSD0}}$	SDRAM Chip-select signal which is multiplexed with the $\overline{\text{CS2}}$ signal. These two signals are selectable by programming the system control register.
$\overline{\text{CSD1}}$	SDRAM Chip-select signal which is multiplexed with $\overline{\text{CS3}}$ signal. These two signals are selectable by programming the system control register. By default, $\overline{\text{CSD1}}$ is selected, so it can be used as boot chip-select by properly configuring BOOT [3:0] input pins.
$\overline{\text{RAS}}$	SDRAM Row Address Select signal
$\overline{\text{CAS}}$	SDRAM Column Address Select signal
$\overline{\text{SDWE}}$	SDRAM Write Enable signal
SDCKE0	SDRAM Clock Enable 0
SDCKE1	SDRAM Clock Enable 1
SDCLK	SDRAM Clock
$\overline{\text{RESET\_SF}}$	Not Used
Clocks and Resets	
EXTAL16M	Crystal input (4 MHz to 16 MHz), or a 16 MHz oscillator input when the internal oscillator circuit is shut down.
XTAL16M	Crystal output
EXTAL32K	32 kHz crystal input
XTAL32K	32 kHz crystal output
CLKO	Clock Out signal selected from internal clock signals.
$\overline{\text{RESET\_IN}}$	Master Reset—External active low Schmitt trigger input signal. When this signal goes active, all modules (except the reset module and the clock control module) are reset.
$\overline{\text{RESET\_OUT}}$	Reset Out—Internal active low output signal from the Watchdog Timer module and is asserted from the following sources: Power-on reset, External reset ($\overline{\text{RESET\_IN}}$), and Watchdog time-out.
POR	Power On Reset—Internal active high Schmitt trigger input signal. The POR signal is normally generated by an external RC circuit designed to detect a power-up event.
JTAG	
$\overline{\text{TRST}}$	Test Reset Pin—External active low signal used to asynchronously initialize the JTAG controller.
$\overline{\text{TDO}}$	Serial Output for test instructions and data. Changes on the falling edge of TCK.
TDI	Serial Input for test instructions and data. Sampled on the rising edge of TCK.
TCK	Test Clock to synchronize test logic and control register access through the JTAG port.
TMS	Test Mode Select to sequence the JTAG test controller's state machine. Sampled on the rising edge of TCK.

4 Functional Description and Application Information

This section provides the electrical information including and timing diagrams for the individual modules of the i.MX1.

4.1 Embedded Trace Macrocell

All registers in the ETM9 are programmed through a JTAG interface. The interface is an extension of the ARM920T processor's TAP controller, and is assigned scan chain 6. The scan chain consists of a 40-bit shift register comprised of the following:

- 32-bit data field
- 7-bit address field
- A read/write bit

The data to be written is scanned into the 32-bit data field, the address of the register into the 7-bit address field, and a 1 into the read/write bit.

A register is read by scanning its address into the address field and a 0 into the read/write bit. The 32-bit data field is ignored. A read or a write takes place when the TAP controller enters the UPDATE-DR state. The timing diagram for the ETM9 is shown in Figure 2. See Table 9 for the ETM9 timing parameters used in Figure 2.

[1] Clock refers to the system clock signal, HCLK, generated from the System DPLL

4.4.1 $\overline{\text{DTACK}}$ Signal Description

The $\overline{\text{DTACK}}$ signal is the external input data acknowledge signal. When using the external $\overline{\text{DTACK}}$ signal as a data acknowledge signal, the bus time-out monitor generates a bus error when a bus cycle is not terminated by the external $\overline{\text{DTACK}}$ signal after 1022 HCLK counts have elapsed. Only the CS5 group supports DTACK signal function when the external DTACK signal is used for data acknowledgement.

4.4.2 $\overline{\text{DTACK}}$ Signal Timing

Figure 6 through Figure 9 show the access cycle timing used by chip-select 5. The signal values and units of measure for this figure are found in the associated tables.

4.14 USB Device Port

Four types of data transfer modes exist for the USB module: control transfers, bulk transfers, isochronous transfers, and interrupt transfers. From the perspective of the USB module, the interrupt transfer type is identical to the bulk data transfer mode, and no additional hardware is supplied to support it. This section covers the transfer modes and how they work from the ground up.

Data moves across the USB in packets. Groups of packets are combined to form data transfers. The same packet transfer mechanism applies to bulk, interrupt, and control transfers. Isochronous data is also moved in the form of packets, however, because isochronous pipes are given a fixed portion of the USB bandwidth at all times, there is no end-of-transfer.

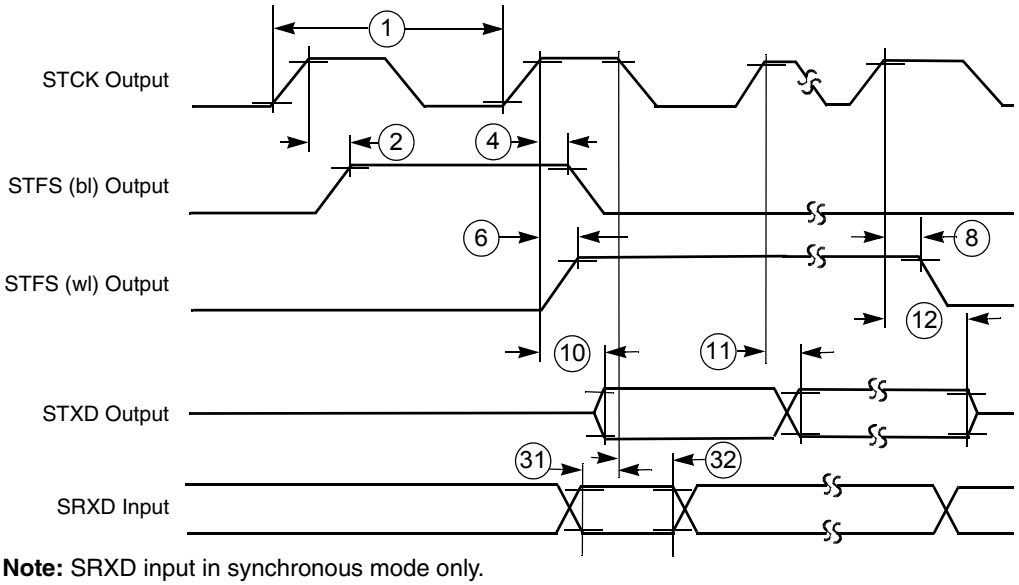
4.16 Synchronous Serial Interface

The transmit and receive sections of the SSI can be synchronous or asynchronous. In synchronous mode, the transmitter and the receiver use a common clock and frame synchronization signal. In asynchronous mode, the transmitter and receiver each have their own clock and frame synchronization signals. Continuous or gated clock mode can be selected. In continuous mode, the clock runs continuously. In gated clock mode, the clock functions only during transmission. The internal and external clock timing diagrams are shown in Figure 65 through Figure 67.

Normal or network mode can also be selected. In normal mode, the SSI functions with one data word of I/O per frame. In network mode, a frame can contain between 2 and 32 data words. Network mode is typically used in star or ring-time division multiplex networks with other processors or codecs, allowing interface to time division multiplexed networks without additional logic. Use of the gated clock is not allowed in network mode. These distinctions result in the basic operating modes that allow the SSI to communicate with a wide variety of devices.



Note: SRXD input in synchronous mode only.

1 All the timings for the SSI are given for a non-inverted serial clock polarity (TSCKP/RSCKP = 0) and a non-inverted frame sync (TFSI/RFSI = 0). If the polarity of the clock and/or the frame sync have been inverted, all the timing remains valid by inverting the clock signal STCK/SRCK and/or the frame sync STFS/SRFS shown in the tables and in the figures.

2 There are 2 sets of I/O signals for the SSI module. They are from Port C primary function (pad 257 to pad 261) and Port B alternate function (pad 283 to pad 288). When SSI signals are configured as outputs, they can be viewed both at Port C primary function and Port B alternate function. When SSI signals are configured as input, the SSI module selects the input based on status of the FMCR register bits in the Clock controller module (CRM). By default, the input are selected from Port C primary function.

3 bl = bit length; wl = word length.

Table 42. Gated Clock Mode Timing Parameters

Ref No.	Parameter	Min	Max	Unit
1	csi_vsync to csi_hsync	180	–	ns
2	csi_hsync to csi_pixclk	1	–	ns
3	csi_d setup time	1	–	ns
4	csi_d hold time	1	–	ns
5	csi_pixclk high time	10.42	–	ns
6	csi_pixclk low time	10.42	–	ns
7	csi_pixclk frequency	0	48	MHz

The limitation on pixel clock rise time / fall time are not specified. It should be calculated from the hold time and setup time, according to:

Rising-edge latch data

max rise time allowed = (positive duty cycle - hold time)
max fall time allowed = (negative duty cycle - setup time)

In most of case, duty cycle is 50 / 50, therefore

max rise time = (period / 2 - hold time)
max fall time = (period / 2 - setup time)

For example: Given pixel clock period = 10ns, duty cycle = 50 / 50, hold time = 1ns, setup time = 1ns.

positive duty cycle = 10 / 2 = 5ns
=> max rise time allowed = 5 - 1 = 4ns

negative duty cycle = 10 / 2 = 5ns
=> max fall time allowed = 5 - 1 = 4ns

Table 43. Non-Gated Clock Mode Parameters (Continued)

Ref No.	Parameter	Min	Max	Unit

4	csi_pixclk high time	10.42	–	ns
5	csi_pixclk low time	10.42	–	ns

Falling-edge latch data

max fall time allowed = (negative duty cycle - hold time)
max rise time allowed = (positive duty cycle - setup time)

6.1 Revision History

Table 45 provides revision history for this release. This history includes technical content revisions only and not stylistic or grammatical changes.

Table 45. i.MX1 Data Sheet Revision History Rev. 7

Location	Revision
Table 1 on page 3 Signal Names and Descriptions	• Added the DMA_REQ signal to table. • Corrected signal name from $\overline{\text{USBD\_OE}}$ to $\overline{\text{USBD\_ROE}}$ • Corrected signal names From: C10 BTRFGN, To: BTRFGND From: G6 SIM_RST, To: SIM_RX From: G7 UART2_TXD, To: SIM_CLK
Table 3 on page 11 Signal Multiplex Table i.MX1	Added Signal Multiplex table from Reference Manual with the following changes: • Changed I/O Supply Voltage, PB31–14, from NVDD3 to NVDD4 • Corrected footnotes 1–5. • Changed AVDD2 references to QVDD, except for C14. Added footnote regarding ESD. • Changed occurrence of SD_SCLK to SD_CLK. • Removed 69K pull-up resistor from EB1, EB2, and added to D9
Table 10 on page 26	Changed first and second parameters descriptions: From: Reference Clock freq range, To: DPLL input clock freq range From: Double clock freq range, To: DPLL output freq range
Table 3 on page 11	Added Signal Multiplex table.

6.2 Reference Documents

The following documents are required for a complete description of the MC9328MX1 and are necessary to design properly with the device. Especially for those not familiar with the ARM920T processor or previous i.MX processor products, the following documents are helpful when used in conjunction with this document.

ARM Architecture Reference Manual (ARM Ltd., order number ARM DDI 0100)

ARM9DT1 Data Sheet Manual (ARM Ltd., order number ARM DDI 0029)

ARM Technical Reference Manual (ARM Ltd., order number ARM DDI 0151C)

EMT9 Technical Reference Manual (ARM Ltd., order number DDI O157E)

MC9328MX1 Product Brief (order number MC9328MX1P)

MC9328MX1 Reference Manual (order number MC9328MX1RM)

The Freescale manuals are available on the Freescale Semiconductors Web site at http://www.freescale.com/imx. These documents may be downloaded directly from the Freescale Web site, or printed versions may be ordered. The ARM Ltd. documentation is available from http://www.arm.com.
