### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

## Architecture Overview

The LatticeECP-DSP and LatticeEC architectures contain an array of logic blocks surrounded by Programmable I/O Cells (PIC). Interspersed between the rows of logic blocks are rows of sysMEM Embedded Block RAM (EBR), as shown in Figures 2-1 and 2-2. In addition, LatticeECP-DSP supports an additional row of DSP blocks, as shown in Figure 2-2.

There are two kinds of logic blocks, the Programmable Functional Unit (PFU) and Programmable Functional unit without RAM/ROM (PFF). The PFU contains the building blocks for logic, arithmetic, RAM, ROM and register functions. The PFF block contains building blocks for logic, arithmetic and ROM functions. Both PFU and PFF blocks are optimized for flexibility, allowing complex designs to be implemented quickly and efficiently. Logic Blocks are arranged in a two-dimensional array. Only one type of block is used per row. The PFU blocks are used on the outside rows. The rest of the core consists of rows of PFF blocks interspersed with rows of PFU blocks. For every three rows of PFF blocks there is a row of PFU blocks.

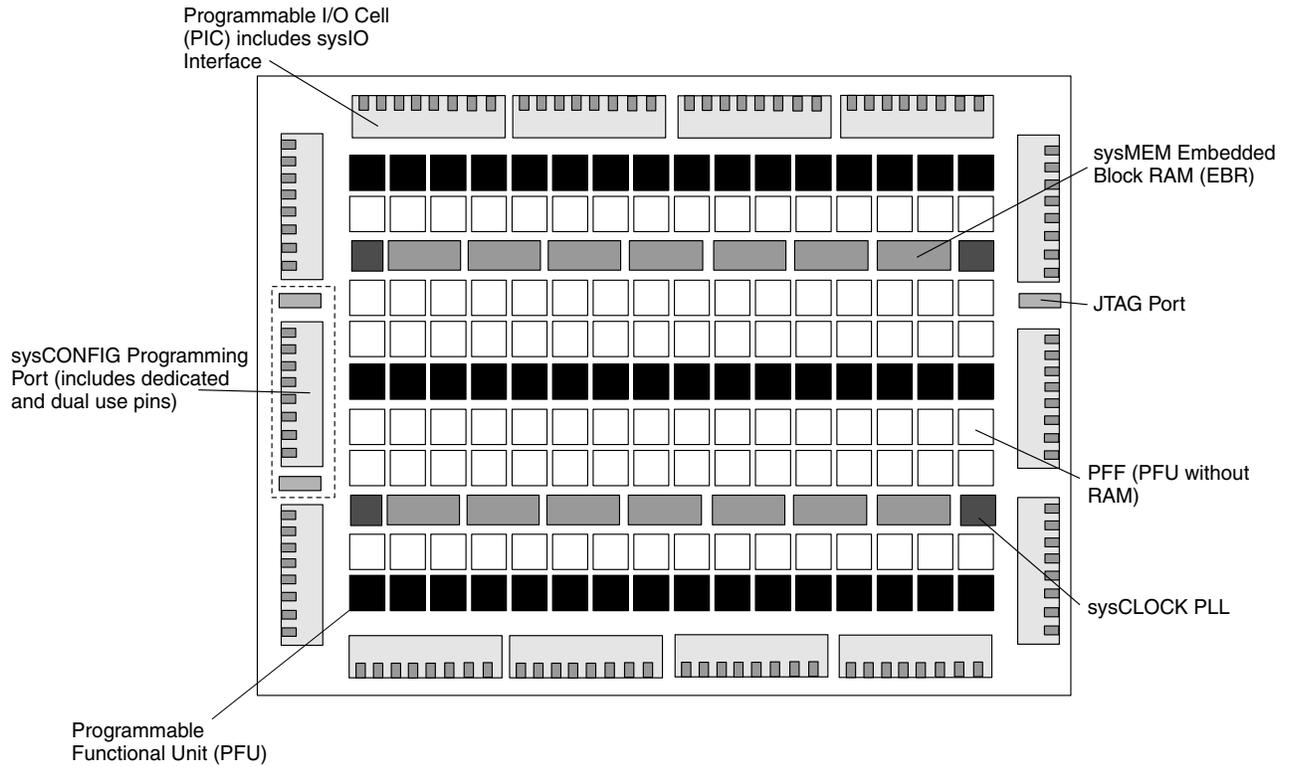

Each PIC block encompasses two PIOs (PIO pairs) with their respective sysI/O interfaces. PIO pairs on the left and right edges of the device can be configured as LVDS transmit/receive pairs. sysMEM EBRs are large dedicated fast memory blocks. They can be configured as RAM or ROM.

The PFU, PFF, PIC and EBR Blocks are arranged in a two-dimensional grid with rows and columns as shown in Figure 2-1. The blocks are connected with many vertical and horizontal routing channel resources. The place and route software tool automatically allocates these routing resources.

At the end of the rows containing the sysMEM Blocks are the sysCLOCK Phase Locked Loop (PLL) Blocks. These PLLs have multiply, divide and phase shifting capability; they are used to manage the phase relationship of the clocks. The LatticeECP/EC architecture provides up to four PLLs per device.

Every device in the family has a JTAG Port with internal Logic Analyzer (ispTRACY) capability. The sysCONFIG™ port which allows for serial or parallel device configuration. The LatticeECP/EC devices use 1.2V as their core voltage.

1. Input or I/O leakage current is measured with the pin configured as an input or as an I/O with the output driver tri-stated. It is not measured with the output driver active. Bus maintenance circuits are disabled.
2.  $T_A$  25°C,  $f = 1.0MHz$
3. For top and bottom general purpose I/O pins, when  $V_{IH}$  is higher than  $V_{CCIO}$ , a transient current typically of 30ns in duration or less with a peak current of 6mA can occur on the high-to-low transition. For left and right I/O banks,  $V_{IH}$  must be less than or equal to  $V_{CCIO}$ .

### BLVDS

The LatticeECP/EC devices support BLVDS standard. This standard is emulated using complementary LVCMOS outputs in conjunction with a parallel external resistor across the driver outputs. BLVDS is intended for use when multi-drop and bi-directional multi-point differential signaling is required. The scheme shown in Figure 3-2 is one possible solution for bi-directional multi-point differential signals.

## Derating Timing Tables

Logic Timing provided in the following sections of the data sheet and the ispLEVER design tools are worst-case numbers in the operating range. Actual delays at nominal temperature and voltage for best-case process, can be much better than the values given in the tables. To calculate logic timing numbers at a particular temperature and voltage multiply the noted numbers with the derating factors provided below.

The junction temperature for the FPGA depends on the power dissipation by the device, the package thermal characteristics ( $\Theta_{JA}$ ), and the ambient temperature, as calculated with the following equation:

$$T_{JMAX} = T_{AMAX} + (\text{Power} * \Theta_{JA})$$

The user must determine this temperature and then use it to determine the derating factor based on the following derating tables:  $T_J$  °C.

**Table 3-5. Delay Derating Table for Internal Blocks**

### Signal Descriptions

Signal Name	I/O	Description
<b>General Purpose</b>		
P[Edge] [Row/Column Number*]_[A/B]	I/O	<p>[Edge] indicates the edge of the device on which the pad is located. Valid edge designations are L (Left), B (Bottom), R (Right), T (Top).</p> <p>[Row/Column Number] indicates the PFU row or the column of the device on which the PIC exists. When Edge is T (Top) or (Bottom), only need to specify Row Number. When Edge is L (Left) or R (Right), only need to specify Column Number.</p> <p>[A/B] indicates the PIO within the PIC to which the pad is connected.</p> <p>Some of these user-programmable pins are shared with special function pins. These pin when not used as special purpose pins can be programmed as I/Os for user logic.</p> <p>During configuration the user-programmable I/Os are tri-stated with an internal pull-up resistor enabled. If any pin is not used (or not bonded to a package pin), it is also tri-stated with an internal pull-up resistor enabled after configuration.</p>
GSRN	I	Global RESET signal (active low). Any I/O pin can be GSRN.
NC	—	No connect.
GND	—	Ground. Dedicated pins.
V <sub>CC</sub>	—	Power supply pins for core logic. Dedicated pins.
V <sub>CCAUX</sub>	—	Auxiliary power supply pin. It powers all the differential and referenced input buffers. Dedicated pins.
V <sub>CCIOx</sub>	—	Power supply pins for I/O bank x. Dedicated pins.
V <sub>REF1_x</sub> , V <sub>REF2_x</sub>	—	Reference supply pins for I/O bank x. Pre-determined pins in each bank are assigned as V <sub>REF</sub> inputs. When not used, they may be used as I/O pins.
XRES	—	10K ohm +/-1% resistor must be connected between this pad and ground.
V <sub>CCPLL</sub>	—	Power supply pin for PLL. Applicable to ECP/EC33 device.
<b>PLL and Clock Functions</b> (Used as user programmable I/O pins when not in use for PLL or clock pins)		
[LOC][num]_PLL[T, C]_IN_A	I	Reference clock (PLL) input pads: ULM, LLM, URM, LRM, num = row from center, T = true and C = complement, index A,B,C...at each side.
[LOC][num]_PLL[T, C]_FB_A	I	Optional feedback (PLL) input pads: ULM, LLM, URM, LRM, num = row from center, T = true and C = complement, index A,B,C...at each side.
PCLK[T, C]_[n:0]_[3:0]	I	Primary Clock pads, T = true and C = complement, n per side, indexed by bank and 0,1,2,3 within bank.
[LOC]DQS[num]	I	DQS input pads: T (Top), R (Right), B (Bottom), L (Left), DQS, num = ball function number. Any pad can be configured to be output.
<b>Test and Programming</b> (Dedicated pins)		
TMS	I	Test Mode Select input, used to control the 1149.1 state machine. Pull-up is enabled during configuration.
TCK	I	Test Clock input pin, used to clock the 1149.1 state machine. No pull-up enabled.

## Thermal Management

Thermal management is recommended as part of any sound FPGA design methodology. To assess the thermal characteristics of a system, Lattice specifies a maximum allowable junction temperature in all device data sheets. Designers must complete a thermal analysis of their specific design to ensure that the device and package do not exceed the junction temperature limits. Refer to the Thermal Management document to find the device/package specific thermal values.

### For Further Information

For further information regarding Thermal Management, refer to the following located on the Lattice website at [www.latticesemi.com](http://www.latticesemi.com).

- Thermal Management document
- Technical Note TN1052 - Power Estimation and Management for LatticeECP/EC and LatticeXP Devices
- Power Calculator tool included with Lattice's ispLEVER design tool, or as a standalone download from [www.latticesemi.com/software](http://www.latticesemi.com/software)

### Revision History

Date	Version	Section	Change Summary
June 2004	01.0	—	Initial release.
August 2004	01.1	Introduction	Added new device LFECP/LFEC33 in Table 1-1.
		Architecture	Added New device LFECP/LFEC33 in Tables 2-9, 2-10 and 2-11.
		DC & Switching Characteristics	Added New device LFECP/LFEC33 on Supply current (Standby) tables.
			Added New device LFECP/LFEC33 on Initialization Supply current tables.
Ordering Information	Added 33K Logic Capacity Device in Part Number Description section.
