## Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

## Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

### Details

For further information about the sysDSP block, please see the list of technical information at the end of this data sheet.

## Programmable I/O Cells (PIC)

Each PIC contains two PIOs connected to their respective sysI/O Buffers which are then connected to the PADs as shown in Figure 2-24. The PIO Block supplies the output data (DO) and the Tri-state control signal (TO) to sysI/O buffer, and receives input from the buffer.

**Figure 2-24. PIC Diagram**

Two adjacent PIOs can be joined to provide a differential I/O pair (labeled as “T” and “C”) as shown in Figure 2-25. The PAD Labels “T” and “C” distinguish the two PIOs. Only the PIO pairs on the left and right edges of the device can be configured as LVDS transmit/receive pairs.

One of every 16 PIOs contains a delay element to facilitate the generation of DQS signals. The DQS signal feeds the DQS bus which spans the set of 16 PIOs. Figure 2-25 shows the assignment of DQS pins in each set of 16 PIOs. The exact DQS pins are shown in a dual function in the Logic Signal Connections table at the end of this data sheet. Additional detail is provided in the Signal Descriptions table at the end of this data sheet. The DQS signal from the bus is used to strobe the DDR data from the memory into input register blocks. This interface is designed for memories that support one DQS strobe per eight bits of data.

**Table 2-12. PIO Signal List**

| Name         | Type                            | Description                                                              |
|--------------|---------------------------------|--------------------------------------------------------------------------|
| CE0, CE1     | Control from the core           | Clock enables for input and output block FFs.                            |
| CLK0, CLK1   | Control from the core           | System clocks for input and output blocks.                               |
| LSR          | Control from the core           | Local Set/Reset.                                                         |
| GSRN         | Control from routing            | Global Set/Reset (active low).                                           |
| INCK         | Input to the core               | Input to Primary Clock Network or PLL reference inputs.                  |
| DQS          | Input to PIO                    | DQS signal from logic (routing) to PIO.                                  |
| INDD         | Input to the core               | Unregistered data input to core.                                         |
| INFF         | Input to the core               | Registered input on positive edge of the clock (CLK0).                   |
| IPOS0, IPOS1 | Input to the core               | DDR <sub>X</sub> registered inputs to the core.                          |
| ONEG0        | Control from the core           | Output signals from the core for SDR and DDR operation.                  |
| OPOS0,       | Control from the core           | Output signals from the core for DDR operation                           |
| OPOS1 ONEG1  | Tristate control from the core  | Signals to Tristate Register block for DDR operation.                    |
| TD           | Tristate control from the core  | Tristate signal from the core used in SDR operation.                     |
| DDRCLKPOL    | Control from clock polarity bus | Controls the polarity of the clock (CLK0) that feed the DDR input block. |

**Figure 2-25. DQS Routing**

## PIO

The PIO contains four blocks: an input register block, output register block, tristate register block and a control logic block. These blocks contain registers for both single data rate (SDR) and double data rate (DDR) operation along with the necessary clock and selection logic. Programmable delay lines used to shift incoming clock and data signals are also included in these blocks.

be shifted in and loaded directly onto test nodes, or test data to be captured and shifted out for verification. The test access port consists of dedicated I/Os: TDI, TDO, TCK and TMS. The test access port has its own supply voltage  $V_{CCJ}$  and can operate with LVCMOS3.3, 2.5, 1.8, 1.5 and 1.2 standards.

For more details on boundary scan test, please see information regarding additional technical documentation at the end of this data sheet.

## Device Configuration

All LatticeECP/EC devices contain two possible ports that can be used for device configuration. The test access port (TAP), which supports bit-wide configuration, and the sysCONFIG port that supports both byte-wide and serial configuration.

The TAP supports both the IEEE Std. 1149.1 Boundary Scan specification and the IEEE Std. 1532 In-System Configuration specification. The sysCONFIG port is a 20-pin interface with six of the I/Os used as dedicated pins and the rest being dual-use pins (please refer to TN1053 for more information about using the dual-use pins as general purpose I/O). There are four configuration options for LatticeECP/EC devices:

1. Industry standard SPI memories.
2. Industry standard byte wide flash and ispMACH 4000 for control/addressing.
3. Configuration from system microprocessor via the configuration bus or TAP.
4. Industry standard FPGA board memory.

On power-up, the FPGA SRAM is ready to be configured with the sysCONFIG port active. The IEEE 1149.1 serial mode can be activated any time after power-up by sending the appropriate command through the TAP port. Once a configuration port is selected, that port is locked and another configuration port cannot be activated until the next power-up sequence.

For more information about device configuration, please see the list of technical documentation at the end of this data sheet.

## Internal Logic Analyzer Capability (ispTRACY)

All LatticeECP/EC devices support an internal logic analyzer diagnostic feature. The diagnostic features provide capabilities similar to an external logic analyzer, such as programmable event and trigger condition and deep trace memory. This feature is enabled by Lattice's ispTRACY. The ispTRACY utility is added into the user design at compile time.

For more information about ispTRACY, please see information regarding additional technical documentation at the end of this data sheet.

## External Resistor

LatticeECP/EC devices require a single external, 10K ohm +/- 1% value between the XRES pin and ground. Device configuration will not be completed if this resistor is missing. There is no boundary scan register on the external resistor pad.

## Oscillator

Every LatticeECP/EC device has an internal CMOS oscillator which is used to derive a master clock for configuration. The oscillator and the master clock run continuously. The default value of the master clock is 2.5MHz. Table 2-15 lists all the available Master Clock frequencies. When a different Master Clock is selected during the design process, the following sequence takes place:

1. User selects a different Master Clock frequency.
2. During configuration the device starts with the default (2.5MHz) Master Clock frequency.
3. The clock configuration settings are contained in the early configuration bit stream.
4. The Master Clock frequency changes to the selected frequency once the clock configuration bits are received.

For further information about the use of this oscillator for configuration, please see the list of technical documentation at the end of this data sheet.

**Table 2-15. Selectable Master Clock (CCLK) Frequencies During Configuration**

| CCLK (MHz) | CCLK (MHz) | CCLK (MHz) |
|------------|------------|------------|
| 2.5*       | 13         | 45         |
| 4.3        | 15         | 51         |
| 5.4        | 20         | 55         |
| 6.9        | 26         | 60         |
| 8.1        | 30         | 130        |
| 9.2        | 34         | —          |
| 10.0       | 41         | —          |

## Density Shifting

The LatticeECP/EC family has been designed to ensure that different density devices in the same package have the same pin-out. Furthermore, the architecture ensures a high success rate when performing design migration from lower density parts to higher density parts. In many cases, it is also possible to shift a lower utilization design targeted for a high-density device to a lower density device. However, the exact details of the final resource utilization will impact the likely success in each case.

### Part Number Description

### Ordering Information

Note: LatticeECP/EC devices are dual marked. For example, the commercial speed grade LFEC20E-4F484C is also marked with industrial grade -3I (LFEC20E-3F484I). The commercial grade is one speed grade faster than the associated dual mark industrial grade. The slowest commercial speed grade does not have industrial markings. The markings appear as follows:

**LatticeEC Commercial (Continued)**

| Part Number    | I/Os | Grade | Package | Pins | Temp. | LUTs  |

| September 2005 | 02.0    | Architecture                   | sysIO section has been updated.                                                                                                                                             |
|                |         | DC & Switching Characteristics | Recommended Operating Conditions has been updated with $V_{CCPLL}$ .                                                                                                        |
|                |         |                                | DC Electrical Characteristics table has been updated                                                                                                                        |
|                |         |                                | Removed 5V Tolerant Input Buffer section.                                                                                                                                   |
|                |         |                                | Register-to-Register performance table has been updated (rev. G 0.28).                                                                                                      |
|                |         |                                | LatticeECP/EC External Switching Characteristics table has been updated (rev. G 0.28).                                                                                      |
|                |         |                                | LatticeECP/EC Internal Switching Characteristics table has been updated (rev. G 0.28).                                                                                      |
|                |         |                                | LatticeECP/EC Family Timing Adders have been updated (rev. G 0.28).                                                                                                         |
|                |         |                                | sysCLOCK PLL timing table has been updated (rev. G 0.28)                                                                                                                    |
|                |         |                                | LatticeECP/EC sysCONFIG Port Timing specification table has been updated (rev. G 0.28).                                                                                     |
|                |         |                                | Master Clock table has been updated (rev. G 0.28).                                                                                                                          |
|                |         |                                | JTAG Port Timing specification table has been updated (rev. G 0.28).                                                                                                        |
|                |         | Pinout Information             | Signal Description table has been updated with $V_{CCPLL}$ .                                                                                                                |
| November 2005  | 02.1    | DC & Switching Characteristics | Pin-to-Pin Performance table has been updated (G 0.30)<br>- 4:1MUX, 8:1MUX, 16:1MUX, 32:1MUX                                                                                |
|                |         |                                | Register-to-Register Performance (G 0.30) - No timing number changes.                                                                                                       |
|                |         |                                | External Switching Characteristics (G 0.30) - No timing number changes.                                                                                                     |
|                |         |                                | Internal Switching Characteristics (G 0.30)<br>$t_{SUP\_DSP}$ , $t_{HP\_DSP}$ , $t_{SUO\_DSP}$ , $t_{HO\_DSP}$ , $t_{COI\_DSP}$ , $t_{COD\_DSP}$ numbers have been updated. |
|                |         |                                | Family Timing Adders (G 0.30) - No timing number changes.                                                                                                                   |
|                |         |                                | sysCLOCK PLL Timing (G 0.30) - No timing number changes.                                                                                                                    |
|                |         |                                | sysCONFIG Port Timing Specifications (G 0.30) - No timing number changes.                                                                                                   |
|                |         |                                | Master Clock (G 0.30) - No timing number changes.                                                                                                                           |
|                |         |                                | JTAG Port Timing Specification (G 0.30) - No timing number changes.                                                                                                         |
|                |         | Ordering Information           | Added 208-PQFP lead-free part numbers.                                                                                                                                      |
| March 2006     | 02.2    | DC & Switching Characteristics | Added footnote 3. to $V_{CCAUX}$ in the Recommended Operating Conditions table.                                                                                             |
| January 2007   | 02.3    | Architecture                   | EBR Asynchronous Reset section added.                                                                                                                                       |
| February 2007  | 02.4    | Architecture                   | Updated EBR Asynchronous Reset section.                                                                                                                                     |
|                |         |                                | Updated Maximum Number of Elements in a Block table - MAC value for x9 changed to 2.                                                                                        |
| May 2007       | 02.5    | Architecture                   | Updated text in Ripple Mode section.                                                                                                                                        |
| November 2007  | 02.6    | DC & Switching Characteristics | Added JTAG Port Waveforms diagram.                                                                                                                                          |
|                |         |                                | Updated $t_{RST}$ timing information in the sysCLOCK PLL Timing table.                                                                                                      |
|                |         | Pinout Information             | Added Thermal Management text section.                                                                                                                                      |
|                |         | Supplemental Information       | Updated title list.                                                                                                                                                         |
| February 2008  | 02.7    | DC & Switching Characteristics | Read/Write Mode (Normal) and Read/Write Mode with Input and Output Registers waveforms in the EBR Memory Timing Diagrams section have been updated.                         |
| September 2012 | 02.8    | All                            | Updated document with new corporate logo.                                                                                                                                   |
