### **Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

#### **Details**

|                                |   |
|--------------------------------|---|
| Product Status                 | Obsolete  |
| Number of LABs/CLBs            | -   |
| Number of Logic Elements/Cells | 6100  |
| Total RAM Bits                 | 94208   |
| Number of I/O                  | 195   |
| Number of Gates                | -   |
| Voltage - Supply               | 1.14V ~ 1.26V   |
| Mounting Type                  | Surface Mount   |
| Operating Temperature          | -40°C ~ 100°C (TJ)  |
| Package / Case                 | 256-BGA   |
| Supplier Device Package        | 256-FPBGA (17x17)   |
| Purchase URL                   | <a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lfec6e-3fn256i">https://www.e-xfl.com/product-detail/lattice-semiconductor/lfec6e-3fn256i</a> |

grammed during configuration or can be adjusted dynamically. In dynamic mode, the PLL may lose lock after adjustment and not relock until the  $t_{LOCK}$  parameter has been satisfied. Additionally, the phase and duty cycle block allows the user to adjust the phase and duty cycle of the CLKOS output.

The sysCLOCK PLLs provide the ability to synthesize clock frequencies. Each PLL has four dividers associated with it: input clock divider, feedback divider, post scalar divider and secondary clock divider. The input clock divider is used to divide the input clock signal, while the feedback divider is used to multiply the input clock signal. The post scalar divider allows the VCO to operate at higher frequencies than the clock output, thereby increasing the frequency range. The secondary divider is used to derive lower frequency outputs.

**Figure 2-11. PLL Diagram**

Figure 2-12 shows the available macros for the PLL. Table 2-5 provides signal description of the PLL Block.

**Figure 2-12. PLL Primitive**

**Table 2-7. Maximum Number of Elements in a Block**

| Width of Multiply | x9 | x18 | x36 |
|-------------------|----|-----|-----|
| MULT              | 8  | 4   | 1   |
| MAC               | 2  | 2   | —   |
| MULTADD           | 4  | 2   | —   |
| MULTADDSUM        | 2  | 1   | —   |

Some options are available in four elements. The input register in all the elements can be directly loaded or can be loaded as shift registers from previous operand registers. In addition by selecting “dynamic operation” in the ‘Signed/Unsigned’ options the operands can be switched between signed and unsigned on every cycle. Similarly by selecting ‘Dynamic operation’ in the ‘Add/Sub’ option the Accumulator can be switched between addition and subtraction on every cycle.

**MULT sysDSP Element**

This multiplier element implements a multiply with no addition or accumulator nodes. The two operands, A and B, are multiplied and the result is available at the output. The user can enable the input/output and pipeline registers. Figure 2-19 shows the MULT sysDSP element.

**Figure 2-19. MULT sysDSP Element**

**MAC sysDSP Element**

In this case the two operands, A and B, are multiplied and the result is added with the previous accumulated value. This accumulated value is available at the output. The user can enable the input and pipeline registers but the output register is always enabled. The output register is used to store the accumulated value. A registered overflow signal is also available. The overflow conditions are provided later in this document. Figure 2-20 shows the MAC sysDSP element.

**Table 2-12. PIO Signal List**

| Name         | Type                            | Description  |
|--------------|---------------------------------|--|
| CE0, CE1     | Control from the core           | Clock enables for input and output block FFs.                            |
| CLK0, CLK1   | Control from the core           | System clocks for input and output blocks.                               |
| LSR          | Control from the core           | Local Set/Reset.   |
| GSRN         | Control from routing            | Global Set/Reset (active low).   |
| INCK         | Input to the core               | Input to Primary Clock Network or PLL reference inputs.                  |
| DQS          | Input to PIO                    | DQS signal from logic (routing) to PIO.                                  |
| INDD         | Input to the core               | Unregistered data input to core.   |
| INFF         | Input to the core               | Registered input on positive edge of the clock (CLK0).                   |
| IPOS0, IPOS1 | Input to the core               | DDR <sub>X</sub> registered inputs to the core.                          |
| ONEG0        | Control from the core           | Output signals from the core for SDR and DDR operation.                  |
| OPOS0,       | Control from the core           | Output signals from the core for DDR operation                           |
| OPOS1 ONEG1  | Tristate control from the core  | Signals to Tristate Register block for DDR operation.                    |
| TD           | Tristate control from the core  | Tristate signal from the core used in SDR operation.                     |
| DDRCLKPOL    | Control from clock polarity bus | Controls the polarity of the clock (CLK0) that feed the DDR input block. |

**Figure 2-25. DQS Routing**

**PIO**

The PIO contains four blocks: an input register block, output register block, tristate register block and a control logic block. These blocks contain registers for both single data rate (SDR) and double data rate (DDR) operation along with the necessary clock and selection logic. Programmable delay lines used to shift incoming clock and data signals are also included in these blocks.

---

## Polarity Control Logic

In a typical DDR Memory interface design, the phase relation between the incoming delayed DQS strobe and the internal system Clock (during the READ cycle) is unknown.

The LatticeECP/EC family contains dedicated circuits to transfer data between these domains. To prevent setup and hold violations at the domain transfer between DQS (delayed) and the system Clock a clock polarity selector is used. This changes the edge on which the data is registered in the synchronizing registers in the input register block. This requires evaluation at the start of each READ cycle for the correct clock polarity.

Prior to the READ operation in DDR memories DQS is in tristate (pulled by termination). The DDR memory device drives DQS low at the start of the preamble state. A dedicated circuit detects this transition. This signal is used to control the polarity of the clock to the synchronizing registers.

## sysI/O Buffer

Each I/O is associated with a flexible buffer referred to as a sysI/O buffer. These buffers are arranged around the periphery of the device in eight groups referred to as Banks. The sysI/O buffers allow users to implement the wide variety of standards that are found in today's systems including LVCMOS, SSTL, HSTL, LVDS and LVPECL.

## sysI/O Buffer Banks

LatticeECP/EC devices have eight sysI/O buffer banks; each is capable of supporting multiple I/O standards. Each sysI/O bank has its own I/O supply voltage ( $V_{CCIO}$ ), and two voltage references  $V_{REF1}$  and  $V_{REF2}$  resources allowing each bank to be completely independent from each other. Figure 2-34 shows the eight banks and their associated supplies.

In the LatticeECP/EC devices, single-ended output buffers and ratioed input buffers (LVTTTL, LVCMOS, PCI and PCI-X) are powered using  $V_{CCIO}$ . LVTTTL, LVCMOS33, LVCMOS25 and LVCMOS12 can also be set as fixed threshold input independent of  $V_{CCIO}$ . In addition to the bank  $V_{CCIO}$  supplies, the LatticeECP/EC devices have a  $V_{CC}$  core logic power supply, and a  $V_{CCAUX}$  supply that power all differential and referenced buffers.

Each bank can support up to two separate VREF voltages, VREF1 and VREF2 that set the threshold for the referenced input buffers. In the LatticeECP/EC devices, some dedicated I/O pins in a bank can be configured to be a reference voltage supply pin. Each I/O is individually configurable based on the bank's supply and reference voltages.

**Figure 3-10. Read Before Write (SP Read/Write on Port A, Input Registers Only)**

Note: Input data and address are registered at the positive edge of the clock and output data appears after the positive edge of the clock.

**Figure 3-11. Write Through (SP Read/Write On Port A, Input Registers Only)**

Note: Input data and address are registered at the positive edge of the clock and output data appears after the positive edge of the clock.

## For Further Information

A variety of technical notes for the LatticeECP/EC family are available on the Lattice web site at [www.latticesemi.com](http://www.latticesemi.com).

- LatticeECP/EC sysIO Usage Guide (TN1056)
- LatticeECP/EC sysCLOCK PLL Design and Usage Guide (TN1049)
- Memory Usage Guide for LatticeECP/EC Devices (TN1051)
- LatticeECP/EC DDR Usage Guide (TN1050)
- Power Estimation and Management for LatticeECP/EC and LatticeXP Devices (TN1052)
- LatticeECP-DSP sysDSP Usage Guide (TN1057)
- LatticeECP/EC sysCONFIG Usage Guide (TN1053)
- IEEE 1149.1 Boundary Scan Testability in Lattice Devices

For further information about interface standards refer to the following web sites:

- JEDEC Standards (LVTTTL, LVCMOS, SSTL, HSTL): [www.jedec.org](http://www.jedec.org)
- PCI: [www.pcisig.com](http://www.pcisig.com)
