Understanding **Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	6100
Total RAM Bits	94208
Number of I/O	97
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	144-LQFP
Supplier Device Package	144-TQFP (20x20)
Purchase URL	https://www.e-xfl.com/product-detail/lattice-semiconductor/lfec6e-3tn144i

September 2012

Data Sheet

Architecture Overview

The LatticeECP-DSP and LatticeEC architectures contain an array of logic blocks surrounded by Programmable I/O Cells (PIC). Interspersed between the rows of logic blocks are rows of sysMEM Embedded Block RAM (EBR), as shown in Figures 2-1 and 2-2. In addition, LatticeECP-DSP supports an additional row of DSP blocks, as shown in Figure 2-2.

There are two kinds of logic blocks, the Programmable Functional Unit (PFU) and Programmable Functional unit without RAM/ROM (PFF). The PFU contains the building blocks for logic, arithmetic, RAM, ROM and register functions. The PFF block contains building blocks for logic, arithmetic and ROM functions. Both PFU and PFF blocks are optimized for flexibility, allowing complex designs to be implemented quickly and efficiently. Logic Blocks are arranged in a two-dimensional array. Only one type of block is used per row. The PFU blocks are used on the outside rows. The rest of the core consists of rows of PFF blocks interspersed with rows of PFU blocks. For every three rows of PFF blocks there is a row of PFU blocks.

Each PIC block encompasses two PIOs (PIO pairs) with their respective sysI/O interfaces. PIO pairs on the left and right edges of the device can be configured as LVDS transmit/receive pairs. sysMEM EBRs are large dedicated fast memory blocks. They can be configured as RAM or ROM.

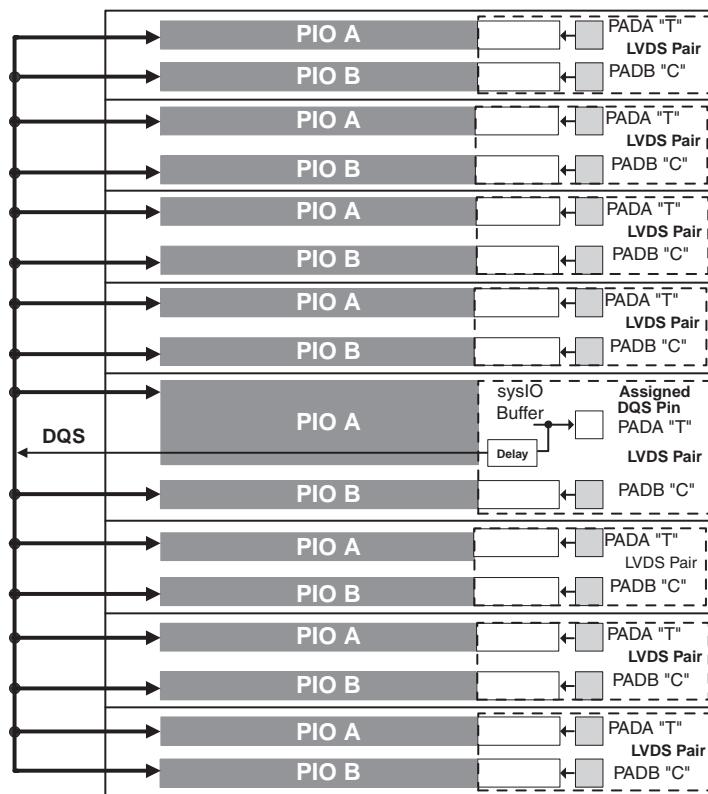

The PFU, PFF, PIC and EBR Blocks are arranged in a two-dimensional grid with rows and columns as shown in Figure 2-1. The blocks are connected with many vertical and horizontal routing channel resources. The place and route software tool automatically allocates these routing resources.

At the end of the rows containing the sysMEM Blocks are the sysCLOCK Phase Locked Loop (PLL) Blocks. These PLLs have multiply, divide and phase shifting capability; they are used to manage the phase relationship of the clocks. The LatticeECP/EC architecture provides up to four PLLs per device.

Every device in the family has a JTAG Port with internal Logic Analyzer (ispTRACY) capability. The sysCONFIG™ port which allows for serial or parallel device configuration. The LatticeECP/EC devices use 1.2V as their core voltage.

Table 2-12. PIO Signal List

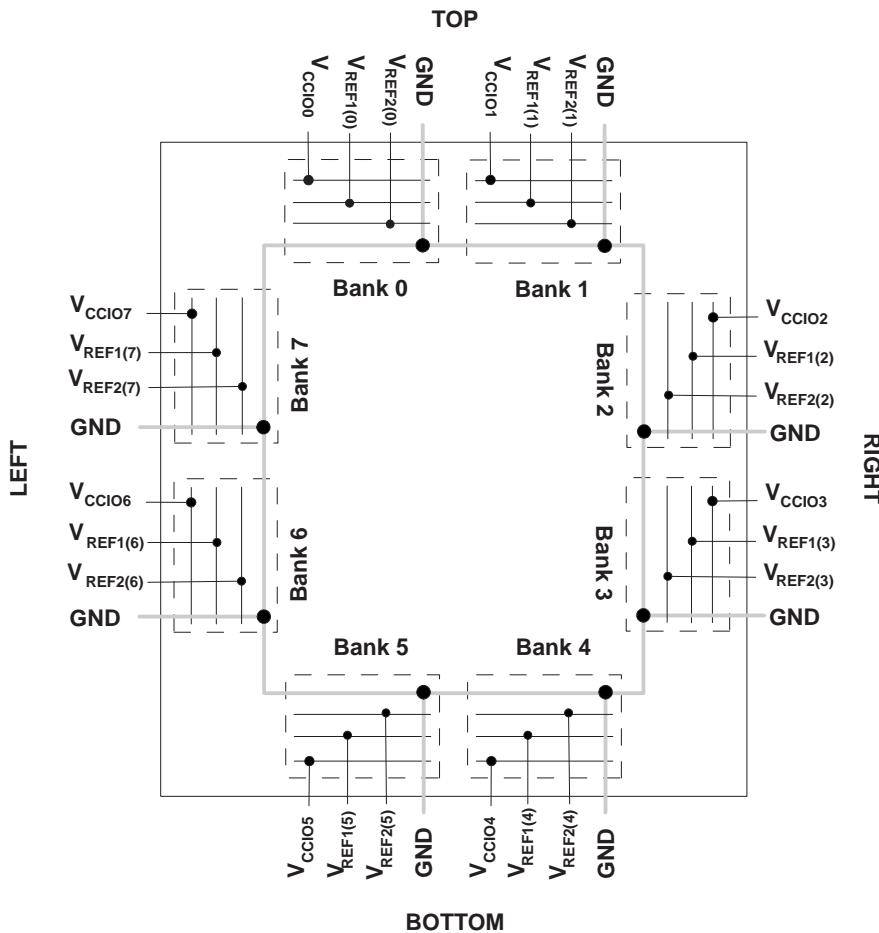

Name	Type	Description
CE0, CE1	Control from the core	Clock enables for input and output block FFs.
CLK0, CLK1	Control from the core	System clocks for input and output blocks.
LSR	Control from the core	Local Set/Reset.
GSRN	Control from routing	Global Set/Reset (active low).
INCK	Input to the core	Input to Primary Clock Network or PLL reference inputs.
DQS	Input to PIO	DQS signal from logic (routing) to PIO.
INDD	Input to the core	Unregistered data input to core.
INFF	Input to the core	Registered input on positive edge of the clock (CLK0).
IPOS0, IPOS1	Input to the core	DDRX registered inputs to the core.
ONEG0	Control from the core	Output signals from the core for SDR and DDR operation.
OPOS0,	Control from the core	Output signals from the core for DDR operation
OPOS1 ONEG1	Tristate control from the core	Signals to Tristate Register block for DDR operation.
TD	Tristate control from the core	Tristate signal from the core used in SDR operation.
DDRCLKPOL	Control from clock polarity bus	Controls the polarity of the clock (CLK0) that feed the DDR input block.

Figure 2-25. DQS Routing

PIO

The PIO contains four blocks: an input register block, output register block, tristate register block and a control logic block. These blocks contain registers for both single data rate (SDR) and double data rate (DDR) operation along with the necessary clock and selection logic. Programmable delay lines used to shift incoming clock and data signals are also included in these blocks.

Figure 2-34. LatticeECP/EC Banks

LatticeECP/EC devices contain two types of sysl/O buffer pairs.

1. Top and Bottom sysl/O Buffer Pairs (Single-Ended Outputs Only)

The sysl/O buffer pairs in the top and bottom banks of the device consist of two single-ended output drivers and two sets of single-ended input buffers (both ratioed and referenced). The referenced input buffer can also be configured as a differential input.

The two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential input buffer and the comp (complementary) pad is associated with the negative side of the differential input buffer.

Only the I/Os on the top and bottom banks have programmable PCI clamps. These I/O banks also support hot socketing with IDK less than 1mA. Note that the PCI clamp is enabled after V_{CC}, V_{CCAUX} and V_{CCIO} are at valid operating levels and the device has been configured.

2. Left and Right sysl/O Buffer Pairs (Differential and Single-Ended Outputs)

The sysl/O buffer pairs in the left and right banks of the device consist of two single-ended output drivers, two sets of single-ended input buffers (both ratioed and referenced) and one differential output driver. The referenced input buffer can also be configured as a differential input. In these banks the two pads in the pair are described as “true” and “comp”, where the true pad is associated with the positive side of the differential I/O, and the comp (complementary) pad is associated with the negative side of the differential I/O.

Only the left and right banks have LVDS differential output drivers. See the I_{DK} specification for I/O leakage current during power-up.

Typical I/O Behavior During Power-up

The internal power-on-reset (POR) signal is deactivated when V_{CC} and V_{CCAUX} have reached satisfactory levels. After the POR signal is deactivated, the FPGA core logic becomes active. It is the user's responsibility to ensure that all other V_{CCIO} banks are active with valid input logic levels to properly control the output logic states of all the I/O banks that are critical to the application. For more information about controlling the output logic state with valid input logic levels during power-up in LatticeECP/EC devices, see the list of technical documentation at the end of this data sheet.

The V_{CC} and V_{CCAUX} supply the power to the FPGA core fabric, whereas the V_{CCIO} supplies power to the I/O buffers. In order to simplify system design while providing consistent and predictable I/O behavior, it is recommended that the I/O buffers be powered-up prior to the FPGA core fabric. V_{CCIO} supplies should be powered-up before or together with the V_{CC} and V_{CCAUX} supplies.

Supported Standards

The LatticeECP/EC sysI/O buffer supports both single-ended and differential standards. Single-ended standards can be further subdivided into LVCMS, LVTTL and other standards. The buffers support the LVTTL, LVCMS 1.2, 1.5, 1.8, 2.5 and 3.3V standards. In the LVCMS and LVTTL modes, the buffer has individually configurable options for drive strength, bus maintenance (weak pull-up, weak pull-down, or a bus-keeper latch) and open drain. Other single-ended standards supported include SSTL and HSTL. Differential standards supported include LVDS, BLVDS, LVPECL, RSRS, differential SSTL and differential HSTL. Tables 2-13 and 2-14 show the I/O standards (together with their supply and reference voltages) supported by the LatticeECP/EC devices. For further information about utilizing the sysI/O buffer to support a variety of standards please see the the list of technical information at the end of this data sheet.

Table 2-13. Supported Input Standards

Input Standard	V_{REF} (Nom.)	V_{CCIO} ¹ (Nom.)
Single Ended Interfaces		
LVTTL	—	—
LVCMS33 ²	—	—
LVCMS25 ²	—	—
LVCMS18	—	1.8
LVCMS15	—	1.5
LVCMS12 ²	—	—

Date	Version	Section	Change Summary
September 2005	02.0	Architecture	sysIO section has been updated.
		DC & Switching Characteristics	Recommended Operating Conditions has been updated with V _{CCPLL} .
			DC Electrical Characteristics table has been updated
			Removed 5V Tolerant Input Buffer section.
			Register-to-Register performance table has been updated (rev. G 0.28).
			LatticeECP/EC External Switching Characteristics table has been updated (rev. G 0.28).
			LatticeECP/EC Internal Switching Characteristics table has been updated (rev. G 0.28).
			LatticeECP/EC Family Timing Adders have been updated (rev. G 0.28).
			sysCLOCK PLL timing table has been updated (rev. G 0.28)
		Pinout Information	Signal Description table has been updated with V _{CCPLL} .
November 2005	02.1	DC & Switching Characteristics	Pin-to-Pin Performance table has been updated (G 0.30) - 4:1MUX, 8:1MUX, 16:1MUX, 32:1MUX Register-to-Register Performance (G 0.30) - No timing number changes.
			External Switching Characteristics (G 0.30) - No timing number changes.
			Internal Switching Characteristics (G 0.30) -t _{SUP_DSP} , t _{HP_DSP} , t _{SUO_DSP} , t _{HO_DSP} , t _{COI_DSP} , t _{COD_DSP} numbers have been updated.
			Family Timing Adders (G 0.30) - No timing number changes.
			sysCLOCK PLL Timing (G 0.30) - No timing number changes.
			sysCONFIG Port Timing Specifications (G 0.30) - No timing number changes.
			Master Clock (G 0.30) - No timing number changes.
			JTAG Port Timing Specification (G 0.30) - No timing number changes.
		Ordering Information	Added 208-PQFP lead-free part numbers.
March 2006	02.2	DC & Switching Characteristics	Added footnote 3. to V _{CCAUX} in the Recommended Operating Conditions table.
January 2007	02.3	Architecture	EBR Asynchronous Reset section added.
February 2007	02.4	Architecture	Updated EBR Asynchronous Reset section.
			Updated Maximum Number of Elements in a Block table - MAC value for x9 changed to 2.
May 2007	02.5	Architecture	Updated text in Ripple Mode section.
November 2007	02.6	DC & Switching Characteristics	Added JTAG Port Waveforms diagram.
			Updated t _{RST} timing information in the sysCLOCK PLL Timing table.
		Pinout Information	Added Thermal Management text section.
		Supplemental Information	Updated title list.
February 2008	02.7	DC & Switching Characteristics	Read/Write Mode (Normal) and Read/Write Mode with Input and Output Registers waveforms in the EBR Memory Timing Diagrams section have been updated.
September 2012	02.8	All	Updated document with new corporate logo.
