## Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

## **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

### Details

Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	19700
Total RAM Bits	434176
Number of I/O	400
Number of Gates	-
Voltage - Supply	1.14V ~ 1.26V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 85°C (TJ)
Package / Case	672-BBGA
Supplier Device Package	672-FPBGA (27x27)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/lattice-semiconductor/lfecp20e-5fn672c">https://www.e-xfl.com/product-detail/lattice-semiconductor/lfecp20e-5fn672c</a>

Data Sheet

### Architecture Overview

The LatticeECP-DSP and LatticeEC architectures contain an array of logic blocks surrounded by Programmable I/O Cells (PIC). Interspersed between the rows of logic blocks are rows of sysMEM Embedded Block RAM (EBR), as shown in Figures 2-1 and 2-2. In addition, LatticeECP-DSP supports an additional row of DSP blocks, as shown in Figure 2-2.

There are two kinds of logic blocks, the Programmable Functional Unit (PFU) and Programmable Functional unit without RAM/ROM (PFF). The PFU contains the building blocks for logic, arithmetic, RAM, ROM and register functions. The PFF block contains building blocks for logic, arithmetic and ROM functions. Both PFU and PFF blocks are optimized for flexibility, allowing complex designs to be implemented quickly and efficiently. Logic Blocks are arranged in a two-dimensional array. Only one type of block is used per row. The PFU blocks are used on the outside rows. The rest of the core consists of rows of PFF blocks interspersed with rows of PFU blocks. For every three rows of PFF blocks there is a row of PFU blocks.

Each PIC block encompasses two PIOs (PIO pairs) with their respective sysI/O interfaces. PIO pairs on the left and right edges of the device can be configured as LVDS transmit/receive pairs. sysMEM EBRs are large dedicated fast memory blocks. They can be configured as RAM or ROM.

The PFU, PFF, PIC and EBR Blocks are arranged in a two-dimensional grid with rows and columns as shown in Figure 2-1. The blocks are connected with many vertical and horizontal routing channel resources. The place and route software tool automatically allocates these routing resources.

At the end of the rows containing the sysMEM Blocks are the sysCLOCK Phase Locked Loop (PLL) Blocks. These PLLs have multiply, divide and phase shifting capability; they are used to manage the phase relationship of the clocks. The LatticeECP/EC architecture provides up to four PLLs per device.

Every device in the family has a JTAG Port with internal Logic Analyzer (ispTRACY) capability. The sysCONFIG™ port which allows for serial or parallel device configuration. The LatticeECP/EC devices use 1.2V as their core voltage.

grammed during configuration or can be adjusted dynamically. In dynamic mode, the PLL may lose lock after adjustment and not relock until the  $t_{LOCK}$  parameter has been satisfied. Additionally, the phase and duty cycle block allows the user to adjust the phase and duty cycle of the CLKOS output.

The sysCLOCK PLLs provide the ability to synthesize clock frequencies. Each PLL has four dividers associated with it: input clock divider, feedback divider, post scalar divider and secondary clock divider. The input clock divider is used to divide the input clock signal, while the feedback divider is used to multiply the input clock signal. The post scalar divider allows the VCO to operate at higher frequencies than the clock output, thereby increasing the frequency range. The secondary divider is used to derive lower frequency outputs.

**Figure 2-11. PLL Diagram**

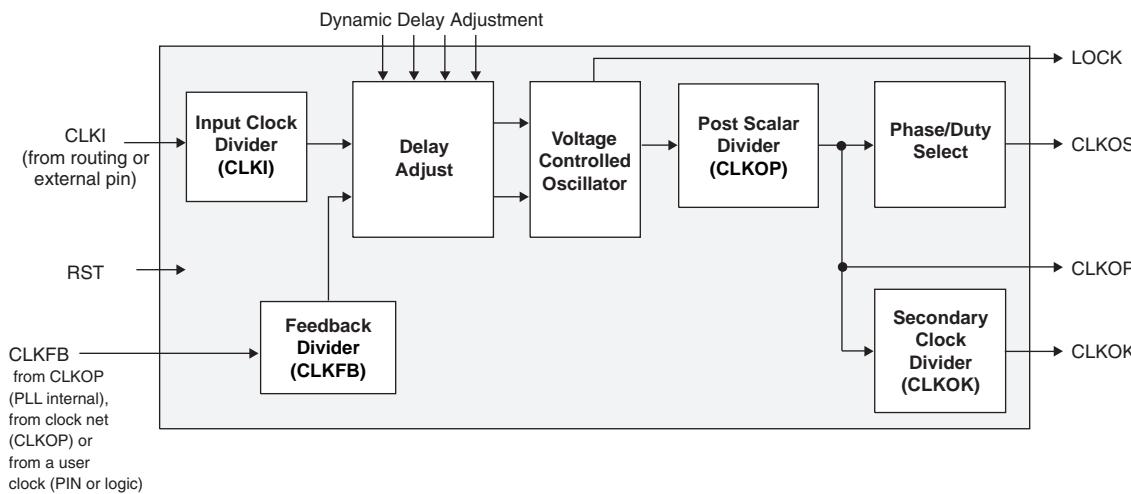

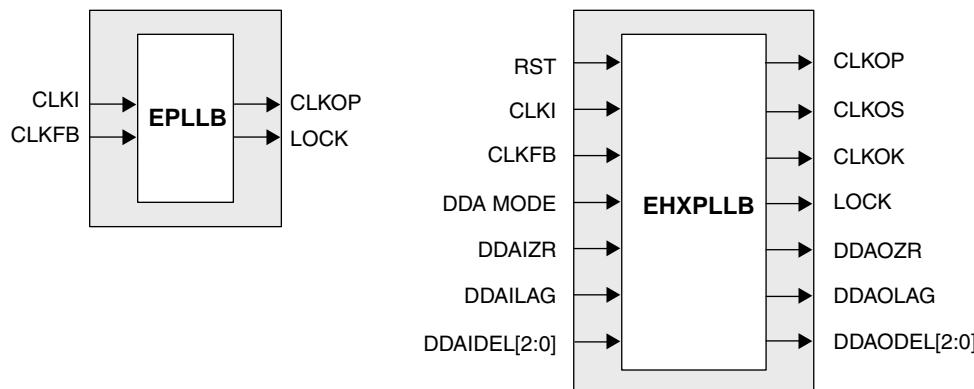

Figure 2-12 shows the available macros for the PLL. Table 2-5 provides signal description of the PLL Block.

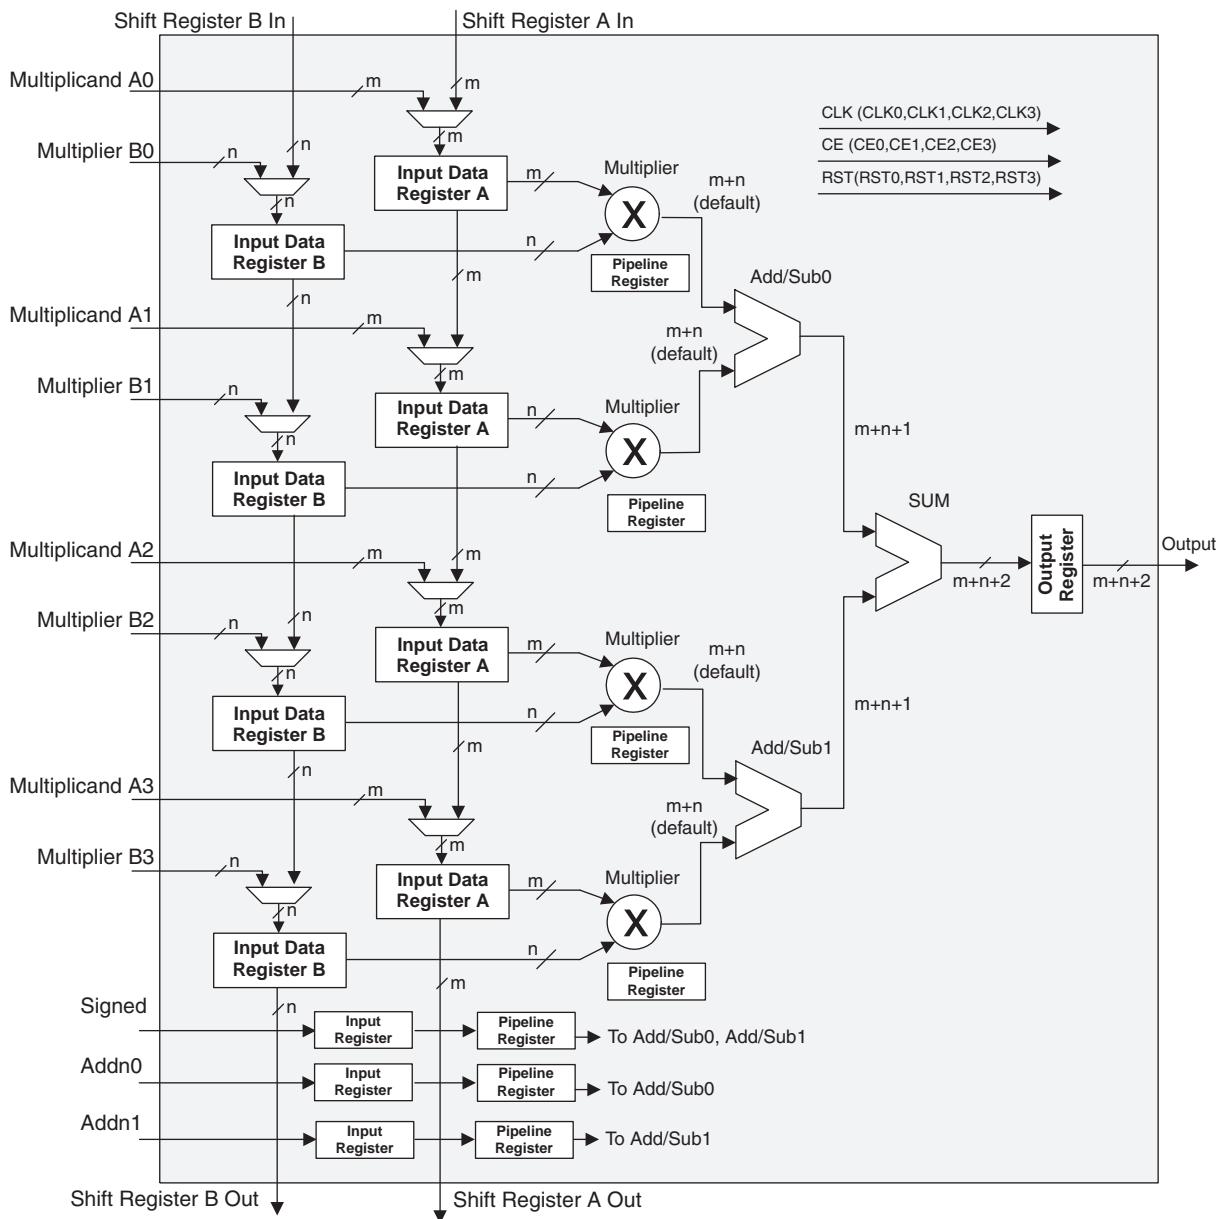

**Figure 2-12. PLL Primitive**

## MULTADD SUM sysDSP Element

In this case, the operands A0 and B0 are multiplied and the result is added/subtracted with the result of the multiplier operation of operands A1 and B1. Additionally the operands A2 and B2 are multiplied and the result is added/subtracted with the result of the multiplier operation of operands A3 and B3. The result of both addition/subtraction are added in a summation block. The user can enable the input, output and pipeline registers. Figure 2-22 shows the MULTADD SUM sysDSP element.

**Figure 2-22. MULTADD SUM**

## Clock, Clock Enable and Reset Resources

Global Clock, Clock Enable and Reset signals from routing are available to every DSP block. Four Clock, Reset and Clock Enable signals are selected for the sysDSP block. From four clock sources (CLK0, CLK1, CLK2, CLK3) one clock is selected for each input register, pipeline register and output register. Similarly Clock enable (CE) and Reset (RST) are selected from their four respective sources (CE0, CE1, CE2, CE3 and RST0, RST1, RST2, RST3) at each input register, pipeline register and output register.

### Input Register Block

The input register block contains delay elements and registers that can be used to condition signals before they are passed to the device core. Figure 2-26 shows the diagram of the input register block.

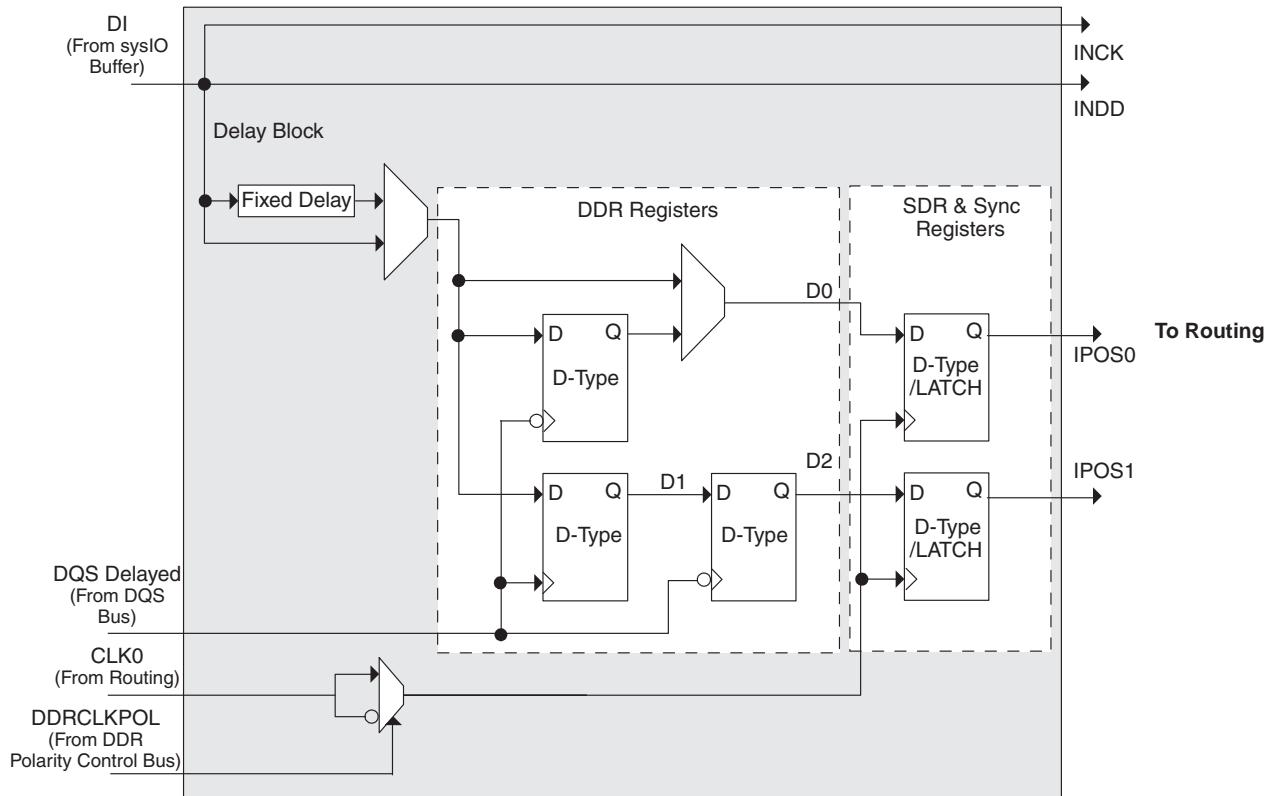

Input signals are fed from the sysI/O buffer to the input register block (as signal DI). If desired the input signal can bypass the register and delay elements and be used directly as a combinatorial signal (INDD), a clock (INCK) and in selected blocks the input to the DQS delay block. If one of the bypass options is not chosen, the signal first passes through an optional delay block. This delay, if selected, reduces input-register hold-time requirement when using a global clock.

The input block allows two modes of operation. In the single data rate (SDR) the data is registered, by one of the registers in the single data rate sync register block, with the system clock. In the DDR Mode two registers are used to sample the data on the positive and negative edges of the DQS signal creating two data streams, D0 and D2. These two data streams are synchronized with the system clock before entering the core. Further discussion on this topic is in the DDR Memory section of this data sheet.

Figure 2-27 shows the input register waveforms for DDR operation and Figure 2-28 shows the design tool primitives. The SDR/SYNC registers have reset and clock enable available.

The signal DDRCLKPOL controls the polarity of the clock used in the synchronization registers. It ensures adequate timing when data is transferred from the DQS to system clock domain. For further discussion on this topic, see the DDR Memory section of this data sheet.

**Figure 2-26. Input Register Diagram**

## Differential HSTL and SSTL

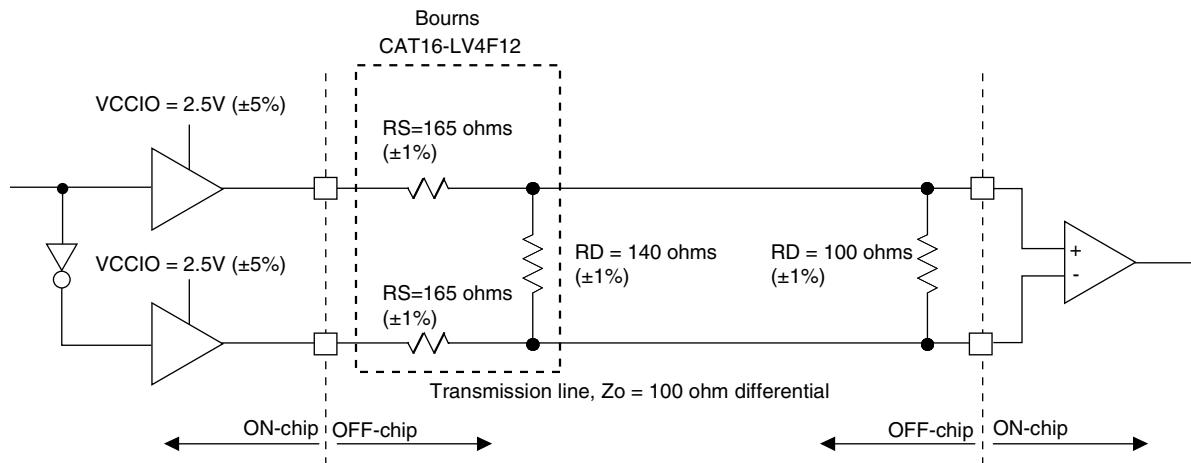

Differential HSTL and SSTL outputs are implemented as a pair of complementary single-ended outputs. All allowable single-ended output classes (class I and class II) are supported in this mode.

### LVDS25E

The top and bottom side of LatticeECP/EC devices support LVDS outputs via emulated complementary LVCMS outputs in conjunction with a parallel resistor across the driver outputs. The scheme shown in

Figure 3-1 is one possible solution for point-to-point signals.

**Figure 3-1. LVDS25E Output Termination Example**

**Table 3-1. LVDS25E DC Conditions**

Parameter	Description	Typical	Units
$V_{OH}$	Output high voltage	1.42	V
$V_{OL}$	Output low voltage	1.08	V
$V_{OD}$	Output differential voltage	0.35	V
$V_{CM}$	Output common mode voltage	1.25	V
$Z_{BACK}$	Back impedance	100	$\frac{1}{4}$

## Typical Building Block Function Performance

### Pin-to-Pin Performance (LVCMOS25 12mA Drive)

Function	-5 Timing	Units
<b>Basic Functions</b>		
16-bit decoder	5.5	ns
32-bit decoder	6.9	ns
64-bit decoder	7.1	ns
4:1 MUX	4.3	ns
8:1 MUX	4.7	ns
16:1 MUX	5.0	ns
32:1 MUX	5.5	ns

### Register-to-Register Performance<sup>1</sup>

Function	-5 Timing	Units
<b>Basic Functions</b>		
16 bit decoder	410	MHz
32 bit decoder	283	MHz
64 bit decoder	272	MHz
4:1 MUX	613	MHz
8:1 MUX	565	MHz
16:1 MUX	526	MHz
32:1 MUX	442	MHz
8-bit adder	363	MHz
16-bit adder	353	MHz
64-bit adder	196	MHz
16-bit counter	414	MHz
32-bit counter	317	MHz
64-bit counter	216	MHz
64-bit accumulator	178	MHz
<b>Embedded Memory Functions</b>		
256x36 Single Port RAM	280	MHz
512x18 True-Dual Port RAM	280	MHz
<b>Distributed Memory Functions</b>		
16x2 Single Port RAM	460	MHz
64x2 Single Port RAM	375	MHz
128x4 Single Port RAM	294	MHz
32x2 Pseudo-Dual Port RAM	392	MHz
64x4 Pseudo-Dual Port RAM	332	MHz
<b>DSP Function<sup>2</sup></b>		
9x9 Pipelined Multiply/Accumulate	242	MHz
18x18 Pipelined Multiply/Accumulate	238	MHz
36x36 Pipelined Multiply	235	MHz

1. These timing numbers were generated using the ispLEVER design tool. Exact performance may vary with design and tool version. The tool uses internal parameters that have been characterized but are not tested on every device.

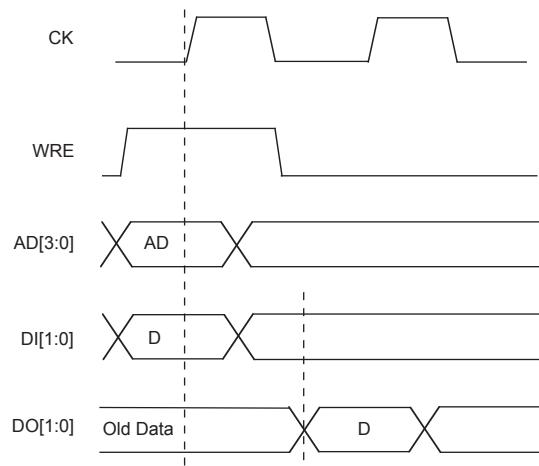

2. Applies to LatticeECP devices only.

## Signal Descriptions (Cont.)

Signal Name	I/O	Description
TDI	I	Test Data in pin. Used to load data into device using 1149.1 state machine. After power-up, this TAP port can be activated for configuration by sending appropriate command. (Note: once a configuration port is selected it is locked. Another configuration port cannot be selected until the power-up sequence). Pull-up is enabled during configuration.
TDO	O	Output pin. Test Data out pin used to shift data out of device using 1149.1.
V <sub>CCJ</sub>	—	V <sub>CCJ</sub> - The power supply pin for JTAG Test Access Port.
<b>Configuration Pads (used during sysCONFIG)</b>		
CFG[2:0]	I	Mode pins used to specify configuration modes values latched on rising edge of INITN. During configuration, a pull-up is enabled. These are dedicated pins.
INITN	I/O	Open Drain pin. Indicates the FPGA is ready to be configured. During configuration, a pull-up is enabled. It is a dedicated pin.
PROGRAMN	I	Initiates configuration sequence when asserted low. This pin always has an active pull-up. This is a dedicated pin.
DONE	I/O	Open Drain pin. Indicates that the configuration sequence is complete, and the startup sequence is in progress. This is a dedicated pin.
CCLK	I/O	Configuration Clock for configuring an FPGA in sysCONFIG mode.
BUSY/SISPI	I/O	Read control command in SPI3 or SPIX mode.
CSN	I	sysCONFIG chip select (Active low). During configuration, a pull-up is enabled.
CS1N	I	sysCONFIG chip select (Active low). During configuration, a pull-up is enabled.
WRITEN	I	Write Data on Parallel port (Active low).
D[7:0]/SPID[0:7]	I/O	sysCONFIG Port Data I/O.
DOUT/CSON	O	Output for serial configuration data (rising edge of CCLK) when using sysCONFIG port.
DI/CSSPIN	I/O	Input for serial configuration data (clocked with CCLK) when using sysCONFIG port. During configuration, a pull-up is enabled. Output when used in SPI/SPIX modes.

# LatticeECP/EC Family Data Sheet

## Supplemental Information

---

September 2012

Data Sheet

### For Further Information

A variety of technical notes for the LatticeECP/EC family are available on the Lattice web site at [www.latticesemi.com](http://www.latticesemi.com).

- LatticeECP/EC sysIO Usage Guide (TN1056)
- LatticeECP/EC sysCLOCK PLL Design and Usage Guide (TN1049)
- Memory Usage Guide for LatticeECP/EC Devices (TN1051)
- LatticeECP/EC DDR Usage Guide (TN1050)
- Power Estimation and Management for LatticeECP/EC and LatticeXP Devices (TN1052)
- LatticeECP-DSP sysDSP Usage Guide (TN1057)
- LatticeECP/EC sysCONFIG Usage Guide (TN1053)
- IEEE 1149.1 Boundary Scan Testability in Lattice Devices

For further information about interface standards refer to the following web sites:

- JEDEC Standards (LVTTI, LVCMOS, SSTL, HSTL): [www.jedec.org](http://www.jedec.org)
- PCI: [www.pcisig.com](http://www.pcisig.com)

Date	Version	Section	Change Summary
December 2004	01.4	Architecture	Updated Hot Socketing Recommended Power Up Sequence section.
		Pinout Information	Added LFEC1, LFEC3, LFECP/EC10, LFECP/EC15 to Pin Information
			Added LFEC1, LFEC3, LFECP/EC10, LFECP/EC15 to Power Supply and NC Connections
			Added LFEC1 and LFEC3 100 TQFP Pinout
			Added LFEC1 and LFEC3 144 TQFP Pinout
			Added LFEC1, LFEC3 and LFECP/EC10 208 PQFP Pinout
			Added LFEC3, LFECP/EC10 and LFECP/EC15 256 fpBGA Pinout
			Added LFECP/EC10 and LFECP/EC15 484 fpBGA Pinout
		Ordering Information	Added Lead-Free Package Designators
			Added Lead-Free Ordering Part Numbers
		Supplemental Information	Updated list of technical notes.
April 2005	01.5	Architecture	EBR memory support section has been updated with clarification.
			Updated sysIO buffer pair section.
		DC & Switching Characteristics	Hot Socketing Specification has been updated.
			DC Electrical Characteristics table ( $I_{IL}$ , $I_{IH}$ ) has been updated.
			Supply Current (Standby) table has been updated.
			Initialization Supply Current table has been updated.
			External Switching Characteristics section has been updated.
		Pinout Information	Removed $t_{RSTW}$ spec. from PLL Parameter table.
			$t_{RST}$ specifications have been updated.
			sysCONFIG Port Timing Specifications ( $t_{BSCL}$ , $t_{IODISS}$ , $t_{PRGMRJ}$ ) have been updated.
			Added LFECP/EC33 Pinout Information
			Pin Information Summary table has been updated.
			Power Supply and NC Connection table has been updated.
			484-fpBGA logic connection has been updated (Ball # J6, J17, P6 and P17 for ECP/EC33 are now called VCCPLL).
			672-fpBGA logic connection has been updated (Ball # K19, L8, U19, U8 for ECP/EC33 are now called VCCPLL).
May 2005	01.6	Introduction	ECP/EC33 EBR SRAM Bits and Blocks have been updated to 498K and 54 respectively.
		Architecture	Table 2-10 has been updated (ECP/EC33 EBR SRAM Bits and Blocks have been updated to 498K and 54 respectively.)
			Recommended Power Up Sequence section has been removed.
		DC & Switching Characteristics	Supply Current (Standby) table has been updated.
			Initialization Supply Current table has been updated.
			Vos test condition has been updated to $(VOP+VOM)/2$ .
			Register-to-Register performance table has been updated (rev. G 0.27).
			External switching characteristics have been updated (rev. G 0.27).
			Internal timing parameters have been updated (rev. G 0.27).
			Timing adders have been updated (rev. G 0.27).
			sysCONFIG port timing specifications have been updated.
		Pinout Information	Pin Information Summary table has been updated.
			Power Supply and NC Connection table has been updated.
		Ordering Information	OPN list has been updated.

Date	Version	Section	Change Summary
September 2005	02.0	Architecture	sysIO section has been updated.
		DC & Switching Characteristics	Recommended Operating Conditions has been updated with V <sub>CCPLL</sub> .
			DC Electrical Characteristics table has been updated
			Removed 5V Tolerant Input Buffer section.
			Register-to-Register performance table has been updated (rev. G 0.28).
			LatticeECP/EC External Switching Characteristics table has been updated (rev. G 0.28).
			LatticeECP/EC Internal Switching Characteristics table has been updated (rev. G 0.28).
			LatticeECP/EC Family Timing Adders have been updated (rev. G 0.28).
			sysCLOCK PLL timing table has been updated (rev. G 0.28)
		Pinout Information	Signal Description table has been updated with V <sub>CCPLL</sub> .
November 2005	02.1	DC & Switching Characteristics	Pin-to-Pin Performance table has been updated (G 0.30) - 4:1MUX, 8:1MUX, 16:1MUX, 32:1MUX Register-to-Register Performance (G 0.30) - No timing number changes.
			External Switching Characteristics (G 0.30) - No timing number changes.
			Internal Switching Characteristics (G 0.30) -t <sub>SUP_DSP</sub> , t <sub>HP_DSP</sub> , t <sub>SUO_DSP</sub> , t <sub>HO_DSP</sub> , t <sub>COI_DSP</sub> , t <sub>COD_DSP</sub> numbers have been updated.
			Family Timing Adders (G 0.30) - No timing number changes.
			sysCLOCK PLL Timing (G 0.30) - No timing number changes.
			sysCONFIG Port Timing Specifications (G 0.30) - No timing number changes.
			Master Clock (G 0.30) - No timing number changes.
			JTAG Port Timing Specification (G 0.30) - No timing number changes.
		Ordering Information	Added 208-PQFP lead-free part numbers.
March 2006	02.2	DC & Switching Characteristics	Added footnote 3. to V <sub>CCAUX</sub> in the Recommended Operating Conditions table.
January 2007	02.3	Architecture	EBR Asynchronous Reset section added.
February 2007	02.4	Architecture	Updated EBR Asynchronous Reset section.
			Updated Maximum Number of Elements in a Block table - MAC value for x9 changed to 2.
May 2007	02.5	Architecture	Updated text in Ripple Mode section.
November 2007	02.6	DC & Switching Characteristics	Added JTAG Port Waveforms diagram.
			Updated t <sub>RST</sub> timing information in the sysCLOCK PLL Timing table.
		Pinout Information	Added Thermal Management text section.
		Supplemental Information	Updated title list.
February 2008	02.7	DC & Switching Characteristics	Read/Write Mode (Normal) and Read/Write Mode with Input and Output Registers waveforms in the EBR Memory Timing Diagrams section have been updated.
September 2012	02.8	All	Updated document with new corporate logo.
