### **Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

## Thermal Characteristics

### Introduction

The temperature variable in Designer software refers to the junction temperature, not the ambient temperature. This is an important distinction because dynamic and static power consumption cause the chip junction to be higher than the ambient temperature.

**EQ 1** can be used to calculate junction temperature.

$$T_J = \text{Junction Temperature} = \Delta T + T_A$$

EQ 1

where:

$T_A$  = Ambient Temperature

$\Delta T$  = Temperature gradient between junction (silicon) and ambient  $\Delta T = \theta_{ja} * P$

$\theta_{ja}$  = Junction-to-ambient of the package.  $\theta_{ja}$  numbers are located in [Table 2-5](#).

P = Power dissipation

### Package Thermal Characteristics

The device junction-to-case thermal resistivity is  $\theta_{jc}$  and the junction-to-ambient air thermal resistivity is  $\theta_{ja}$ . The thermal characteristics for  $\theta_{ja}$  are shown for two air flow rates. The absolute maximum junction temperature is 110°C. **EQ 2** shows a sample calculation of the absolute maximum power dissipation allowed for an 896-pin FBGA package at commercial temperature and in still air.

$$\text{Maximum Power Allowed} = \frac{\text{Max. junction temp. } (\text{°C}) - \text{Max. ambient temp. } (\text{°C})}{\theta_{ja} (\text{°C/W})} = \frac{110\text{°C} - 70\text{°C}}{13.6\text{°C/W}} = 5.88 \text{ W}$$

## Global Resource Characteristics

### A3PE600 Clock Tree Topology

Clock delays are device-specific. Figure 2-38 is an example of a global tree used for clock routing. The global tree presented in Figure 2-38 is driven by a CCC located on the west side of the A3PE600 device. It is used to drive all D-flip-flops in the device.

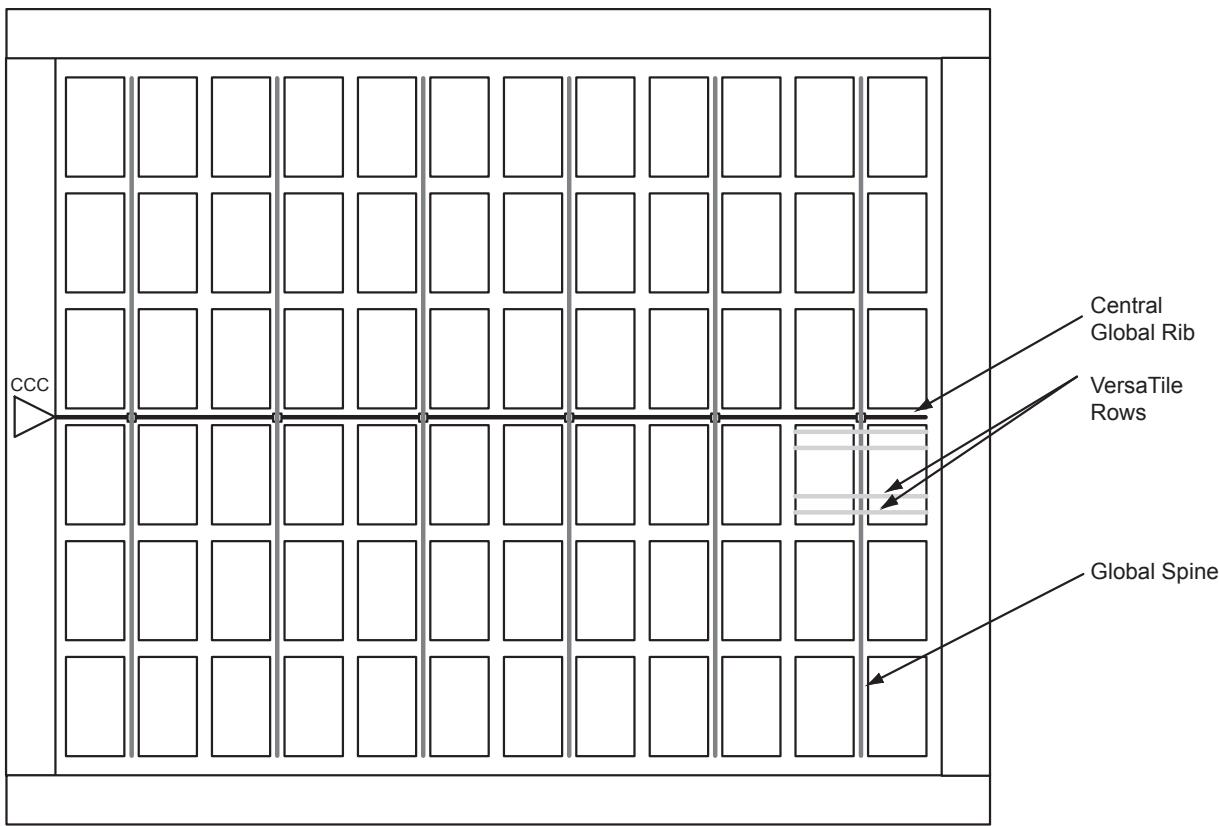

Figure 2-38 • Example of Global Tree Use in an A3PE600 Device for Clock Routing

### Global Tree Timing Characteristics

Global clock delays include the central rib delay, the spine delay, and the row delay. Delays do not include I/O input buffer clock delays, as these are I/O standard-dependent, and the clock may be driven and conditioned internally by the CCC module. For more details on clock conditioning capabilities, refer to the "Clock Conditioning Circuits" section on page 2-70. Table 2-95 on page 2-69, Table 2-96 on page 2-69, and Table 2-97 on page 2-69 present minimum and maximum global clock delays within the device. Minimum and maximum delays are measured with minimum and maximum loading.

Revision	Changes	Page
Revision 11 (August 2012)	<p>Added a Note stating "VMV pins must be connected to the corresponding VCCI pins. See the "<a href="#">VMVx I/O Supply Voltage (quiet)</a>" section on page 3-1 for further information." to <a href="#">Table 2-1 • Absolute Maximum Ratings</a> and <a href="#">Table 2-2 • Recommended Operating Conditions</a><sup>1</sup> (SAR 38322).</p> <p>The drive strength, IOL, and IOH value for 3.3 V GTL and 2.5 V GTL was changed from 25 mA to 20 mA in the following tables (SAR 31924):</p> <ul style="list-style-type: none"> <li>"Summary of Maximum and Minimum DC Input and Output Levels" table</li> <li>"Summary of I/O Timing Characteristics—Software Default Settings" table</li> <li>"I/O Output Buffer Maximum Resistances<sup>1</sup>" table</li> <li>"Minimum and Maximum DC Input and Output Levels" table</li> <li>"Minimum and Maximum DC Input and Output Levels" table</li> </ul> <p>Also added note stating "Output drive strength is below JEDEC specification" for Tables 2-17 and 2-19.</p> <p>Additionally, the IOL and IOH values for 3.3 V GTL+ and 2.5 V GTL+ were corrected from 51 to 35 (for 3.3 V GTL+) and from 40 to 33 (for 2.5 V GTL+) in table <a href="#">Table 2-13</a> (SAR 39714).</p> <p>"Duration of Short Circuit Event Before Failure" table was revised to change the maximum temperature from 110°C to 100°C, with an example of six months instead of three months (SAR 37934).</p> <p>The following sentence was deleted from the "<a href="#">2.5 V LVCMOS</a>" section (SAR 34796):</p> <p>"It uses a 5 V-tolerant input buffer and push-pull output buffer." This change was made in revision 10 and omitted from the change table in error.</p>	<a href="#">2-1</a> <a href="#">3-1</a> <a href="#">2-1</a>  <a href="#">2-16</a> <a href="#">2-19</a> <a href="#">2-20</a> <a href="#">2-39</a> <a href="#">2-40</a>  <a href="#">2-22</a>  <a href="#">2-30</a>
Revision 11 (continued)	Figure 2-11 was updated to match tables in the " <a href="#">Summary of I/O Timing Characteristics – Default I/O Software Settings</a> " section (SAR 34889).	<a href="#">2-38</a>
	In <a href="#">Table 2-81</a> VIL and VIH were revised so that the maximum is 3.6 V for all listed values of VCCI (SAR 37222).	<a href="#">2-52</a>
	Figure 2-47 and Figure 2-48 are new (SAR 34848).	<a href="#">2-79</a>
	The following sentence was removed from the " <a href="#">VMVx I/O Supply Voltage (quiet)</a> " section in the " <a href="#">Pin Descriptions and Packaging</a> " chapter: "Within the package, the VMV plane is decoupled from the simultaneous switching noise originating from the output buffer VCCI domain" and replaced with "Within the package, the VMV plane biases the input stage of the I/Os in the I/O banks" (SAR 38322). The datasheet mentions that "VMV pins must be connected to the corresponding VCCI pins" for an ESD enhancement.	<a href="#">3-1</a>
