Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Advanced Architecture

The proprietary ProASIC3E architecture provides granularity comparable to standard-cell ASICs. The ProASIC3E device consists of five distinct and programmable architectural features (Figure 1-1 on page 3):

- FPGA VersaTiles
- Dedicated FlashROM
- Dedicated SRAM/FIFO memory
- Extensive CCCs and PLLs
- Pro I/O structure

The FPGA core consists of a sea of VersaTiles. Each VersaTile can be configured as a three-input logic function, a D-flip-flop (with or without enable), or a latch by programming the appropriate flash switch interconnections. The versatility of the ProASIC3E core tile as either a three-input lookup table (LUT) equivalent or as a D-flip-flop/latch with enable allows for efficient use of the FPGA fabric. The VersaTile capability is unique to the ProASIC family of third-generation architecture Flash FPGAs. VersaTiles are connected with any of the four levels of routing hierarchy. Flash switches are distributed throughout the device to provide nonvolatile, reconfigurable interconnect programming. Maximum core utilization is possible for virtually any design.

1. Dynamic power consumption is given for standard load and software default drive strength and output slew.
2. PDC3 is the static power (where applicable) measured on VCCI.
3. PAC10 is the total dynamic power measured on VCC and VCCI.
4. All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD8-B specification.

Guidelines

Toggle Rate Definition

A toggle rate defines the frequency of a net or logic element relative to a clock. It is a percentage. If the toggle rate of a net is 100%, this means that this net switches at half the clock frequency. Below are some examples:

- The average toggle rate of a shift register is 100% as all flip-flop outputs toggle at half of the clock frequency.
- The average toggle rate of an 8-bit counter is 25%:
 - Bit 0 (LSB) = 100%
 - Bit 1 = 50%
 - Bit 2 = 25%
 - ...
 - Bit 7 (MSB) = 0.78125%
 - Average toggle rate = $(100\% + 50\% + 25\% + 12.5\% + \dots + 0.78125\%) / 8$

Enable Rate Definition

Output enable rate is the average percentage of time during which tristate outputs are enabled. When nontristate output buffers are used, the enable rate should be 100%.

Table 2-11 • Toggle Rate Guidelines Recommended for Power Calculation

Component	Definition	Guideline
α_1	Toggle rate of VersaTile outputs	10%
α_2	I/O buffer toggle rate	10%

Table 2-12 • Enable Rate Guidelines Recommended for Power Calculation

Component	Definition	Guideline
β_1	I/O output buffer enable rate	100%
β_2	RAM enable rate for read operations	12.5%
β_3	RAM enable rate for write operations	12.5%

1.5 V LVCMOS (JESD8-11)

Low-Voltage CMOS for 1.5 V is an extension of the LVCMOS standard (JESD8-5) used for general-purpose 1.5 V applications. It uses a 1.5 V input buffer and a push-pull output buffer.

Table 2-41 • Minimum and Maximum DC Input and Output Levels

Notes:

1. IIL is the input leakage current per I/O pin over recommended operation conditions where $-0.3\text{ V} < V_{IN} < V_{IL}$.
2. IIH is the input leakage current per I/O pin over recommended operating conditions $V_{IH} < V_{IN} < V_{CCI}$. Input current is larger when operating outside recommended ranges.
3. Currents are measured at high temperature (100°C junction temperature) and maximum voltage.
4. Currents are measured at 85°C junction temperature.
5. Software default selection highlighted in gray.

Notes:

1. This delay is a function of voltage and temperature. See [Table 2-6 on page 2-5](#) for deratings
2. $T_J = 25^\circ\text{C}$, $V_{CC} = 1.5\text{ V}$.
3. When the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available. Refer to the Libero SoC Online Help for more information.
4. Maximum value obtained for a –2 speed-grade device in worst-case commercial conditions. For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-5](#) for derating values.
5. Tracking jitter is defined as the variation in clock edge position of PLL outputs with reference to the PLL input clock edge. Tracking jitter does not measure the variation in PLL output period, which is covered by the period jitter parameter.

Revision	Changes	Page
Revision 10 (March 2012)	The "In-System Programming (ISP) and Security" section and "Security" section were revised to clarify that although no existing security measures can give an absolute guarantee, Microsemi FPGAs implement the best security available in the industry (SAR 34669).	I, 1-1
	The Y security option and Licensed DPA Logo were added to the "ProASIC3E Ordering Information" section. The trademarked Licensed DPA Logo identifies that a product is covered by a DPA counter-measures license from Cryptography Research (SAR 34727).	III
	The following sentence was removed from the "Advanced Architecture" section: "In addition, extensive on-chip programming circuitry allows for rapid, single-voltage (3.3 V) programming of IGLOOe devices via an IEEE 1532 JTAG interface" (SAR 34689).	1-3
	The "Specifying I/O States During Programming" section is new (SAR 34699).	1-6
	VCCPLL in Table 2-2 • Recommended Operating Conditions ¹ was corrected from "1.4 to 1.6 V" to "1.425 to 1.575 V" (SAR 33851). The T _J symbol was added to the table and notes regarding T _A and T _J were removed. The second of two parameters in the VCCI and VMV row, called "3.3 V DC supply voltage," was corrected to "3.0 V DC supply voltage" (SAR 37227).	2-2
	The reference to guidelines for global spines and VersaTile rows, given in the "Global Clock Contribution—P _{CLOCK} " section, was corrected to the "Spine Architecture" section of the Global Resources chapter in the <i>ProASIC3E FPGA Fabric User's Guide</i> (SAR 34735).	2-9
	t _{DOUT} was corrected to t _{DIN} in Figure 2-3 • Input Buffer Timing Model and Delays (example) (SAR 37109).	2-13
	The typo related to the values for 3.3 V LVCMOS Wide Range in Table 2-17 • Summary of I/O Timing Characteristics—Software Default Settings was corrected (SAR 37227).	2-19
	The notes regarding drive strength in the "Summary of I/O Timing Characteristics – Default I/O Software Settings" section and "3.3 V LVCMOS Wide Range" section and tables were revised for clarification. They now state that the minimum drive strength for the default software configuration when run in wide range is ±100 µA. The drive strength displayed in software is supported in normal range only. For a detailed I/V curve, refer to the IBIS models (SAR 34763).	2-18, 2-27

Revision	Changes	Page
Revision 10 (continued)	"TBD" for 3.3 V LVCMOS Wide Range in Table 2-19 • I/O Output Buffer Maximum Resistances¹ and Table 2-21 • I/O Short Currents IOSH/IOSL was replaced by "Same as regular 3.3 V LVCMOS" (SAR 33853). 3.3 V LVCMOS Wide Range information was separated from regular 3.3 V LVCMOS and placed into its own new section, " 3.3 V LVCMOS Wide Range ". Values of IOSH and IOSL were added in Table 2-29 • Minimum and Maximum DC Input and Output Levels (SAR 33853).	2-20, 2-27
	The formulas in the table notes for Table 2-20 • I/O Weak Pull-Up/Pull-Down Resistances were corrected (SAR 34755).	2-21
	The AC Loading figures in the " Single-Ended I/O Characteristics " section were updated to match tables in the " Summary of I/O Timing Characteristics – Default I/O Software Settings " section (SAR 34889).	2-24
	The titles and subtitles for Table 2-31 • 3.3 V LVCMOS Wide Range High Slew and Table 2-32 • 3.3 V LVCMOS Wide Range Low Slew were corrected (SAR 37227).	2-28, 2-29
	The following notes were removed from Table 2-78 • LVDS Minimum and Maximum DC Input and Output Levels (SAR 34812): ±5% Differential input voltage = ±350 mV	2-50
	Minimum pulse width High and Low values were added to the tables in the " Global Tree Timing Characteristics " section. The maximum frequency for global clock parameter was removed from these tables because a frequency on the global is only an indication of what the global network can do. There are other limiters such as the SRAM, I/Os, and PLL. SmartTime software should be used to determine the design frequency (SAR 36957).	2-68
	A note was added to Table 2-98 • ProASIC3E CCC/PLL Specification indicating that when the CCC/PLL core is generated by Microsemi core generator software, not all delay values of the specified delay increments are available (SAR 34824).	2-70
	The following figures were deleted. Reference was made to a new application note, Simultaneous Read-Write Operations in Dual-Port SRAM for Flash-Based cSoCs and FPGAs , which covers these cases in detail (SAR 34872). Figure 2-44 • Write Access after Write onto Same Address Figure 2-45 • Read Access after Write onto Same Address Figure 2-46 • Write Access after Read onto Same Address The port names in the SRAM " Timing Waveforms ", SRAM " Timing Characteristics " tables, Figure 2-49 • FIFO Reset , and the FIFO " Timing Characteristics " tables were revised to ensure consistency with the software names (SAR 35750).	2-74, 2-75, 2-79, 2-82
	The " Pin Descriptions and Packaging " chapter is new (SAR 34771).	3-1
July 2010	Package names used in the " Package Pin Assignments " section were revised to match standards given in Package Mechanical Drawings (SAR 34771).	4-1
	Pin E6 for the FG256 package was corrected from VvB0 to VCCIB0 (SARs 30364, 31597, 26243).	4-9
July 2010	The versioning system for datasheets has been changed. Datasheets are assigned a revision number that increments each time the datasheet is revised. The " ProASIC3E Device Status " table on page II indicates the status for each device in the device family.	N/A
