Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Notes:

1. *When considering migrating your design to a lower- or higher-density device, refer to the ProASIC3E FPGA Fabric User's Guide to ensure compliance with design and board migration requirements.*
2. *Each used differential I/O pair reduces the number of single-ended I/Os available by two.*
3. *For A3PE1500 and A3PE3000 devices, the usage of certain I/O standards is limited as follows:*
   – SSTL3(I) and (II): up to 40 I/Os per north or south bank
   – LVPECL / GTL+ 3.3 V / GTL 3.3 V: up to 48 I/Os per north or south bank

Thermal Characteristics

Introduction

The temperature variable in Designer software refers to the junction temperature, not the ambient temperature. This is an important distinction because dynamic and static power consumption cause the chip junction to be higher than the ambient temperature.

EQ 1 can be used to calculate junction temperature.

T_J = Junction Temperature = $\Delta T + T_A$

EQ 1

where:

T_A = Ambient Temperature

ΔT = Temperature gradient between junction (silicon) and ambient $\Delta T = \theta_{ja} * P$

θ_{ja} = Junction-to-ambient of the package. θ_{ja} numbers are located in Table 2-5.

P = Power dissipation

Package Thermal Characteristics

The device junction-to-case thermal resistivity is θ_{jc} and the junction-to-ambient air thermal resistivity is θ_{ja}. The thermal characteristics for θ_{ja} are shown for two air flow rates. The absolute maximum junction temperature is 110°C. EQ 2 shows a sample calculation of the absolute maximum power dissipation allowed for an 896-pin FBGA package at commercial temperature and in still air.

$$\text{Maximum Power Allowed} = \frac{\text{Max. junction temp. } (°C) - \text{Max. ambient temp. } (°C)}{\theta_{ja}(°C/W)} = \frac{110°C - 70°C}{13.6°C/W} = 5.88\ W$$

LVDS/B-LVDS/M-LVDS/ LVPECL	No requirement	10 ns *	10 years (100°C)

*Note: *For clock signals and similar edge-generating signals, refer to the "ProASIC3/E SSO and Pin Placement Guidelines" chapter of the ProASIC3E FPGA Fabric User's Guide. The maximum input rise/fall time is related to the noise induced into the input buffer trace. If the noise is low, then the rise time and fall time of input buffers can be increased beyond the maximum value. The longer the rise/fall times, the more susceptible the input signal is to the board noise. Microsemi recommends signal integrity evaluation/characterization of the system to ensure that there is no excessive noise coupling into input signals.*

2.5 V GTL

Gunning Transceiver Logic is a high-speed bus standard (JESD8-3). It provides a differential amplifier input buffer and an open-drain output buffer. The VCCI pin should be connected to 2.5 V.

Refer to the I/O Structure section of the *ProASIC3E FPGA Fabric User's Guide* for an explanation of the naming of global pins.

JTAG Pins

Low power flash devices have a separate bank for the dedicated JTAG pins. The JTAG pins can be run at any voltage from 1.5 V to 3.3 V (nominal). VCC must also be powered for the JTAG state machine to operate, even if the device is in bypass mode; VJTAG alone is insufficient. Both VJTAG and VCC to the part must be supplied to allow JTAG signals to transition the device. Isolating the JTAG power supply in a separate I/O bank gives greater flexibility in supply selection and simplifies power supply and PCB design. If the JTAG interface is neither used nor planned for use, the VJTAG pin together with the TRST pin could be tied to GND.

TCK Test Clock

Test clock input for JTAG boundary scan, ISP, and UJTAG. The TCK pin does not have an internal pull-up/-down resistor. If JTAG is not used, Microsemi recommends tying off TCK to GND through a resistor placed close to the FPGA pin. This prevents JTAG operation in case TMS enters an undesired state.

Note that to operate at all VJTAG voltages, 500 W to 1 kΩ will satisfy the requirements. Refer to Table 3-1 for more information.

***Table 3-1* • Recommended Tie-Off Values for the TCK and TRST Pins**

VJTAG	Tie-Off Resistance
VJTAG at 3.3 V	200 Ω to 1 kΩ
VJTAG at 2.5 V	200 Ω to 1 kΩ
VJTAG at 1.8 V	500 Ω to 1 kΩ
VJTAG at 1.5 V	500 Ω to 1 kΩ

Notes:

1. *Equivalent parallel resistance if more than one device is on the JTAG chain*
2. *The TCK pin can be pulled up/down.*
3. *The TRST pin is pulled down.*

TDI Test Data Input

Serial input for JTAG boundary scan, ISP, and UJTAG usage. There is an internal weak pull-up resistor on the TDI pin.

TDO Test Data Output

Serial output for JTAG boundary scan, ISP, and UJTAG usage.

TMS Test Mode Select

The TMS pin controls the use of the IEEE 1532 boundary scan pins (TCK, TDI, TDO, TRST). There is an internal weak pull-up resistor on the TMS pin.

TRST Boundary Scan Reset Pin

The TRST pin functions as an active-low input to asynchronously initialize (or reset) the boundary scan circuitry. There is an internal weak pull-up resistor on the TRST pin. If JTAG is not used, an external pull-down resistor could be included to ensure the test access port (TAP) is held in reset mode. The resistor values must be chosen from Table 3-1 and must satisfy the parallel resistance value requirement. The values in Table 3-1 correspond to the resistor recommended when a single device is used, and the equivalent parallel resistor when multiple devices are connected via a JTAG chain.

In critical applications, an upset in the JTAG circuit could allow entrance to an undesired JTAG state. In such cases, Microsemi recommends tying off TRST to GND through a resistor placed close to the FPGA pin.

Note that to operate at all VJTAG voltages, 500 Ω to 1 kΩ will satisfy the requirements.

Revision	Changes	Page
Revision 9 (Aug 2009) Product Brief v1.2	All references to speed grade –F have been removed from this document.	N/A
	The "Pro I/Os with Advanced I/O Standards" section was revised to add definitions of hot-swap and cold-sparing.	1-6
DC and Switching Characteristics v1.3	3.3 V LVCMOS and 1.2 V LVCMOS Wide Range support was added to the datasheet. This affects all tables that contained 3.3 V LVCMOS and 1.2 V LVCMOS data.	N/A
	IIL and IIH input leakage current information was added to all "Minimum and Maximum DC Input and Output Levels" tables.	N/A
	–F was removed from the datasheet. The speed grade is no longer supported.	N/A
	In the Table 2-2 • Recommended Operating Conditions [1] "3.0 V DC supply voltage" and note 4 are new.	2-2
	The Table 2-4 • Overshoot and Undershoot Limits [1] table was updated.	2-3
	The Table 2-6 • Temperature and Voltage Derating Factors for Timing Delays table was updated.	2-5
	There are new parameters and data was updated in the Table 2-99 • RAM4K9 table.	2-76
	There are new parameters and data was updated in the Table 2-100 • RAM512X18 table.	2-77
Revision 8 (Feb 2008) Product Brief v1.1	Table 1-2 • ProASIC3E FPGAs Package Sizes Dimensions is new.	1-II
Revision 7 (Jun 2008) DC and Switching Characteristics v1.2	The title of Table 2-4 • Overshoot and Undershoot Limits [1] was modified to remove "as measured on quiet I/Os." Table note 2 was revised to remove "estimated SSO density over cycles." Table note 3 was deleted.	2-3
	Table 2-78 • LVDS Minimum and Maximum DC Input and Output Levels was updated.	2-50
Revision 6 (Jun 2008)	The A3PE600 "FG484" table was missing G22. The pin and its function were added to the table.	4-27
Revision 5 (Jun 2008) Packaging v1.4	The naming conventions changed for the following pins in the "FG484" for the A3PE600: **Pin Number** — **New Function Name** J19 — IO45PPB2V1 K20 — IO45NPB2V1 M2 — IO114NPB6V1 N1 — IO114PPB6V1 N4 — GFC2/IO115PPB6V1 P3 — IO115NPB6V1	4-22
Revision 4 (Apr 2008) Product Brief v1.0	The product brief portion of the datasheet was divided into two sections and given a version number, starting at v1.0. The first section of the document includes features, benefits, ordering information, and temperature and speed grade offerings. The second section is a device family overview.	N/A
Packaging v1.3	The "FG324" package diagram was replaced.	4-12

Revision	Changes	Page
Revision 3 (Apr 2008) Packaging v1.2	The following pins had duplicates and the extra pins were deleted from the "PQ208" A3PE3000 table: 36, 62, 171 Note: There were no pin function changes in this update.	4-2
	The following pins had duplicates and the extra pins were deleted from the "FG324" table: E2, E3, E16, E17, P2, P3, T16, U17 Note: There were no pin function changes in this update.	4-12
	The "FG256" pin table was updated for the A3PE600 device because the old PAT were based on the IFX die, and this is the final UMC die version.	4-9
	The "FG484" was updated for the A3PE600 device because the old PAT were based on the IFX die, and this is the final UMC die version.	4-22
	The following pins had duplicates and the extra pins were deleted from the "FG896" table: AD6, AE5, AE28, AF29, F5, F26, G6, G25 Note: There were no pin function changes in this update.	4-41
Revision 2 (Mar 2008) Product Brief rev. 1	The FG324 package was added to the "ProASIC3E Product Family" table, the "I/Os Per Package1" table, and the "Temperature Grade Offerings" table for A3PE3000.	I, II, IV
Revision 1 (Feb 2008) DC and Switching Characteristics v1.1	In Table 2-3 • Flash Programming Limits – Retention, Storage and Operating Temperature 1, Maximum Operating Junction Temperature was changed from 110°C to 100°C for both commercial and industrial grades.	2
	The "PLL Behavior at Brownout Condition" section is new.	2-4
	In the "PLL Contribution—PPLL" section, the following was deleted: FCLKIN is the input clock frequency.	2-10
	In Table 2-14 • Summary of Maximum and Minimum DC Input Levels, the note was incorrect. It previously said T_J and it was corrected and changed to T_A.	2-17
	In Table 2-98 • ProASIC3E CCC/PLL Specification, the SCLK parameter and note 1 are new.	2-70
	Table 2-103 • JTAG 1532 was populated with the parameter data, which was not in the previous version of the document.	2-83
Revision 1 (cont'd) Packaging v1.1	The "PQ208" pin table for A3PE3000 was updated.	4-2
	The "FG324" pin table for A3PE3000 is new.	4-13
	The "FG484" pin table for A3PE3000 is new.	4-17
	The "FG896" pin table for A3PE3000 is new.	4-41
Revision 0 (Jan 2008)	This document was previously in datasheet v2.1. As a result of moving to the handbook format, Actel has restarted the version numbers. The new version number is 51700098-001-0.	N/A
v2.1 (July 2007)	CoreMP7 information was removed from the "Features and Benefits" section.	1-I
	The M1 device part numbers have been updated in ProASIC3E Product Family, "Packaging Tables", "Temperature Grade Offerings", "Speed Grade and Temperature Grade Matrix", and "Speed Grade and Temperature Grade Matrix".	1-I

Datasheet Categories

Categories

In order to provide the latest information to designers, some datasheet parameters are published before data has been fully characterized from silicon devices. The data provided for a given device, as highlighted in the "ProASIC3E Device Status" table on page II, is designated as either "Product Brief," "Advance," "Preliminary," or "Production." The definitions of these categories are as follows:

Product Brief

The product brief is a summarized version of a datasheet (advance or production) and contains general product information. This document gives an overview of specific device and family information.

Advance

This version contains initial estimated information based on simulation, other products, devices, or speed grades. This information can be used as estimates, but not for production. This label only applies to the DC and Switching Characteristics chapter of the datasheet and will only be used when the data has not been fully characterized.

Preliminary

The datasheet contains information based on simulation and/or initial characterization. The information is believed to be correct, but changes are possible.

Production

This version contains information that is considered to be final.

Export Administration Regulations (EAR)

The products described in this document are subject to the Export Administration Regulations (EAR). They could require an approved export license prior to export from the United States. An export includes release of product or disclosure of technology to a foreign national inside or outside the United States.

Safety Critical, Life Support, and High-Reliability Applications Policy

The products described in this advance status document may not have completed the Microsemi qualification process. Products may be amended or enhanced during the product introduction and qualification process, resulting in changes in device functionality or performance. It is the responsibility of each customer to ensure the fitness of any product (but especially a new product) for a particular purpose, including appropriateness for safety-critical, life-support, and other high-reliability applications. Consult the Microsemi SoC Products Group Terms and Conditions for specific liability exclusions relating to life-support applications. A reliability report covering all of the SoC Products Group's products is available at *Microsemi SoC Reliability Report*. Microsemi also offers a variety of enhanced qualification and lot acceptance screening procedures. Contact your local sales office for additional reliability information.
