Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	516096
Number of I/O	620
Number of Gates	3000000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	896-BGA
Supplier Device Package	896-FBGA (31x31)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a3pe3000-1fgg896i

I/Os Per Package[1]

ProASIC3E Devices	A3PE600		A3PE1500 [3]		A3PE3000 [3]	
Cortex-M1 Devices [2]			M1A3PE1500		M1A3PE3000	
	I/O Types					
Package	Single-Ended I/O[1]	Differential I/O Pairs	Single-Ended I/O[1]	Differential I/O Pairs	Single-Ended I/O[1]	Differential I/O Pairs
PQ208	147	65	147	65	147	65
FG256	165	79	–	–	–	–
FG324	–	–	–	–	221	110
FG484	270	135	280	139	341	168
FG676	–	–	444	222	–	–
FG896	–	–	–	–	620	310

Notes:
1. *When considering migrating your design to a lower- or higher-density device, refer to the ProASIC3E FPGA Fabric User's Guide to ensure compliance with design and board migration requirements.*
2. *Each used differential I/O pair reduces the number of single-ended I/Os available by two.*
3. *For A3PE1500 and A3PE3000 devices, the usage of certain I/O standards is limited as follows:*
   – SSTL3(I) and (II): up to 40 I/Os per north or south bank
   – LVPECL / GTL+ 3.3 V / GTL 3.3 V: up to 48 I/Os per north or south bank
   – SSTL2(I) and (II) / GTL+ 2.5 V/ GTL 2.5 V: up to 72 I/Os per north or south bank
4. *FG256 and FG484 are footprint-compatible packages.*
5. *When using voltage-referenced I/O standards, one I/O pin should be assigned as a voltage-referenced pin (VREF) per minibank (group of I/Os).*
6. *"G" indicates RoHS-compliant packages. Refer to the "ProASIC3E Ordering Information" on page III for the location of the "G" in the part number.*

Table 1-2 • ProASIC3E FPGAs Package Sizes Dimensions

A3PE1500	Production	M1A3PE1500	Production
A3PE3000	Production	M1A3PE3000	Production

Single Chip

Flash-based FPGAs store their configuration information in on-chip flash cells. Once programmed, the configuration data is an inherent part of the FPGA structure, and no external configuration data needs to be loaded at system power-up (unlike SRAM-based FPGAs). Therefore, flash-based ProASIC3E FPGAs do not require system configuration components such as EEPROMs or microcontrollers to load device configuration data. This reduces bill-of-materials costs and PCB area, and increases security and system reliability.

Instant On

Flash-based ProASIC3E devices support Level 0 of the Instant On classification standard. This feature helps in system component initialization, execution of critical tasks before the processor wakes up, setup and configuration of memory blocks, clock generation, and bus activity management. The Instant On feature of flash-based ProASIC3E devices greatly simplifies total system design and reduces total system cost, often eliminating the need for CPLDs and clock generation PLLs that are used for these purposes in a system. In addition, glitches and brownouts in system power will not corrupt the ProASIC3E device's flash configuration, and unlike SRAM-based FPGAs, the device will not have to be reloaded when system power is restored. This enables the reduction or complete removal of the configuration PROM, expensive voltage monitor, brownout detection, and clock generator devices from the PCB design. Flash-based ProASIC3E devices simplify total system design and reduce cost and design risk while increasing system reliability and improving system initialization time.

Firm Errors

Firm errors occur most commonly when high-energy neutrons, generated in the upper atmosphere, strike a configuration cell of an SRAM FPGA. The energy of the collision can change the state of the configuration cell and thus change the logic, routing, or I/O behavior in an unpredictable way. These errors are impossible to prevent in SRAM FPGAs. The consequence of this type of error can be a complete system failure. Firm errors do not exist in the configuration memory of ProASIC3E flash-based FPGAs. Once it is programmed, the flash cell configuration element of ProASIC3E FPGAs cannot be altered by high-energy neutrons and is therefore immune to them. Recoverable (or soft) errors occur in the user data SRAM of all FPGA devices. These can easily be mitigated by using error detection and correction (EDAC) circuitry built into the FPGA fabric.

Low Power

Flash-based ProASIC3E devices exhibit power characteristics similar to an ASIC, making them an ideal choice for power-sensitive applications. ProASIC3E devices have only a very limited power-on current surge and no high-current transition period, both of which occur on many FPGAs.

ProASIC3E devices also have low dynamic power consumption to further maximize power savings.

Advanced Flash Technology

The ProASIC3E family offers many benefits, including nonvolatility and reprogrammability through an advanced flash-based, 130-nm LVCMOS process with seven layers of metal. Standard CMOS design techniques are used to implement logic and control functions. The combination of fine granularity, enhanced flexible routing resources, and abundant flash switches allows for very high logic utilization without compromising device routability or performance. Logic functions within the device are interconnected through a four-level routing hierarchy.

2 – ProASIC3E DC and Switching Characteristics

General Specifications

DC and switching characteristics for –F speed grade targets are based only on simulation.

The characteristics provided for the –F speed grade are subject to change after establishing FPGA specifications. Some restrictions might be added and will be reflected in future revisions of this document. The –F speed grade is only supported in the commercial temperature range.

Operating Conditions

Stresses beyond those listed in Table 2-1 may cause permanent damage to the device.

Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Absolute Maximum Ratings are stress ratings only; functional operation of the device at these or any other conditions beyond those listed under the Recommended Operating Conditions specified in Table 2-2 on page 2-2 is not implied.

Table 2-1 • **Absolute Maximum Ratings**

Symbol	Parameter	Limits	Units
VCC	DC core supply voltage	–0.3 to 1.65	V
VJTAG	JTAG DC voltage	–0.3 to 3.75	V
VPUMP	Programming voltage	–0.3 to 3.75	V
VCCPLL	Analog power supply (PLL)	–0.3 to 1.65	V
VCCI [2]	DC I/O output buffer supply voltage	–0.3 to 3.75	V
VMV [2]	DC I/O input buffer supply voltage	–0.3 to 3.75	V
VI	I/O input voltage	–0.3 V to 3.6 V (when I/O hot insertion mode is enabled) –0.3 V to (VCCI + 1 V) or 3.6 V, whichever voltage is lower (when I/O hot-insertion mode is disabled)	V
T_{STG} [3]	Storage temperature	–65 to +150	°C
T_J [3]	Junction temperature	+125	°C

Notes:

1. *The device should be operated within the limits specified by the datasheet. During transitions, the input signal may undershoot or overshoot according to the limits shown in Table 2-3 on page 2-2.*
2. *VMV pins must be connected to the corresponding VCCI pins. See the "VMVx I/O Supply Voltage (quiet)" section on page 3-1 for further information.*
3. *For flash programming and retention maximum limits, refer to Table 2-3 on page 2-2, and for recommended operating limits, refer to Table 2-2 on page 2-2.*

Overview of I/O Performance

Summary of I/O DC Input and Output Levels – Default I/O Software Settings

Table 2-13 • Summary of Maximum and Minimum DC Input and Output Levels Applicable to Commercial and Industrial Conditions

I/O Standard	Drive Strength	Equivalent Software Default Drive Strength Option[1]	Slew Rate	VIL Min. V	VIL Max. V	VIH Min. V	VIH Max. V	VOL Max. V	VOH Min. V	IOL[3] mA	IOH[3] mA

Notes:

1. *The minimum drive strength for any LVCMOS 3.3 V software configuration when run in wide range is ±100 µA. Drive strength displayed in the software is supported for normal range only. For a detailed I/V curve, refer to the IBIS models.*
2. *Output drive strength is below JEDEC specification.*
3. *Currents are measured at 85°C junction temperature.*
4. *Output Slew Rates can be extracted from IBIS Models, located at http://www.microsemi.com/index.php?option=com_content&id=1671&lang=en&view=article.*

Voltage-Referenced I/O Characteristics

3.3 V GTL

Gunning Transceiver Logic is a high-speed bus standard (JESD8-3). It provides a differential amplifier input buffer and an open-drain output buffer. The VCCI pin should be connected to 3.3 V.

Table 2-48 **• Minimum and Maximum DC Input and Output Levels**

3.3 V GTL	VIL		VIH		VOL	VOH	IOL	IOH	IOSL	IOSH	IIL	IIH
Drive Strength	Min. V	Max. V	Min. V	Max. V	Max. V	Min. V	mA	mA	Max. mA[1]	Max. mA[1]	µA[2]	µA[2]
20 mA[3]	–0.3	VREF – 0.05	VREF + 0.05	3.6	0.4	–	20	20	181	268	10	10

Notes:

1. *Currents are measured at high temperature (100°C junction temperature) and maximum voltage.*
2. *Currents are measured at 85°C junction temperature.*
3. *Output drive strength is below JEDEC specification.*

Note: For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-5 for derating values.

LVPECL

Low-Voltage Positive Emitter-Coupled Logic (LVPECL) is another differential I/O standard. It requires that one data bit be carried through two signal lines. Like LVDS, two pins are needed. It also requires external resistor termination.

The full implementation of the LVDS transmitter and receiver is shown in an example in Figure 2-24. The building blocks of the LVPECL transmitter-receiver are one transmitter macro, one receiver macro, three board resistors at the transmitter end, and one resistor at the receiver end. The values for the three driver resistors are different from those used in the LVDS implementation because the output standard specifications are different.

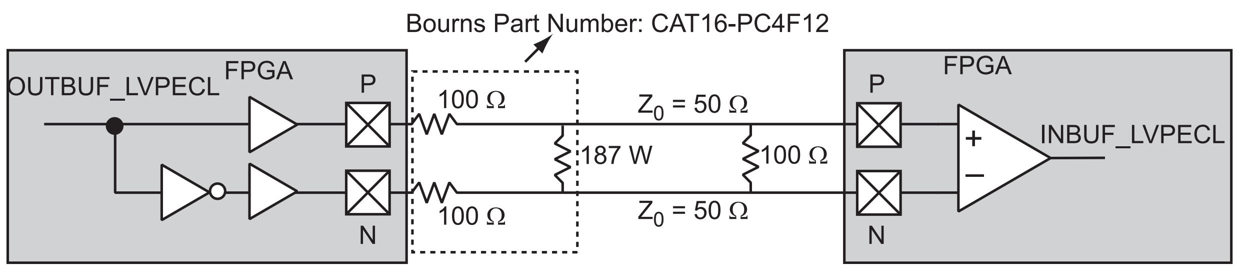

Figure 2-24 **• LVPECL Circuit Diagram and Board-Level Implementation**

Table 2-81 **• Minimum and Maximum DC Input and Output Levels**

DC Parameter	Description	Min.	Max.	Min.	Max.	Min.	Max.	Units

Notes:

1. *For more information, refer to the application note Simultaneous Read-Write Operations in Dual-Port SRAM for Flash-Based cSoCs and FPGAs.*
2. *For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-5 for derating values.*

VJTAG **JTAG Supply Voltage**

Low power flash devices have a separate bank for the dedicated JTAG pins. The JTAG pins can be run at any voltage from 1.5 V to 3.3 V (nominal). Isolating the JTAG power supply in a separate I/O bank gives greater flexibility in supply selection and simplifies power supply and PCB design. If the JTAG interface is neither used nor planned for use, the VJTAG pin together with the TRST pin could be tied to GND. It should be noted that VCC is required to be powered for JTAG operation; VJTAG alone is insufficient. If a device is in a JTAG chain of interconnected boards, the board containing the device can be powered down, provided both VJTAG and VCC to the part remain powered; otherwise, JTAG signals will not be able to transition the device, even in bypass mode.

Microsemi recommends that VPUMP and VJTAG power supplies be kept separate with independent filtering capacitors rather than supplying them from a common rail.

VPUMP **Programming Supply Voltage**

For programming, VPUMP should be 3.3 V nominal. During normal device operation, VPUMP can be left floating or can be tied (pulled up) to any voltage between 0 V and the VPUMP maximum. Programming power supply voltage (VPUMP) range is listed in the datasheet.

When the VPUMP pin is tied to ground, it will shut off the charge pump circuitry, resulting in no sources of oscillation from the charge pump circuitry.

For proper programming, 0.01 µF and 0.33 µF capacitors (both rated at 16 V) are to be connected in parallel across VPUMP and GND, and positioned as close to the FPGA pins as possible.

Microsemi recommends that VPUMP and VJTAG power supplies be kept separate with independent filtering capacitors rather than supplying them from a common rail.

User-Defined Supply Pins

VREF **I/O Voltage Reference**

Reference voltage for I/O minibanks. VREF pins are configured by the user from regular I/Os, and any I/O in a bank, except JTAG I/Os, can be designated the voltage reference I/O. Only certain I/O standards require a voltage reference—HSTL (I) and (II), SSTL2 (I) and (II), SSTL3 (I) and (II), and GTL/GTL+. One VREF pin can support the number of I/Os available in its minibank.

User Pins

I/O **User Input/Output**

The I/O pin functions as an input, output, tristate, or bidirectional buffer. Input and output signal levels are compatible with the I/O standard selected.

During programming, I/Os become tristated and weakly pulled up to VCCI. With VCCI, VMV, and VCC supplies continuously powered up, when the device transitions from programming to operating mode, the I/Os are instantly configured to the desired user configuration.

Unused I/Os are configured as follows:

- Output buffer is disabled (with tristate value of high impedance)
- Input buffer is disabled (with tristate value of high impedance)
- Weak pull-up is programmed

GL **Globals**

GL I/Os have access to certain clock conditioning circuitry (and the PLL) and/or have direct access to the global network (spines). Additionally, the global I/Os can be used as regular I/Os, since they have identical capabilities. Unused GL pins are configured as inputs with pull-up resistors.

See more detailed descriptions of global I/O connectivity in the "Clock Conditioning Circuits in Low Power Flash Devices and Mixed Signal FPGAs" chapter of the *ProASIC3E FPGA Fabric User's Guide*. All inputs labeled GC/GF are direct inputs into the quadrant clocks. For example, if GAA0 is used for an input, GAA1 and GAA2 are no longer available for input to the quadrant globals. All inputs labeled GC/GF are direct inputs into the chip-level globals, and the rest are connected to the quadrant globals. The inputs to the global network are multiplexed, and only one input can be used as a global input.

Revision	Changes	Page
Revision 9 (Aug 2009) Product Brief v1.2	All references to speed grade –F have been removed from this document.	N/A
	The "Pro I/Os with Advanced I/O Standards" section was revised to add definitions of hot-swap and cold-sparing.	1-6
DC and Switching Characteristics v1.3	3.3 V LVCMOS and 1.2 V LVCMOS Wide Range support was added to the datasheet. This affects all tables that contained 3.3 V LVCMOS and 1.2 V LVCMOS data.	N/A
	IIL and IIH input leakage current information was added to all "Minimum and Maximum DC Input and Output Levels" tables.	N/A
	–F was removed from the datasheet. The speed grade is no longer supported.	N/A
	In the Table 2-2 • Recommended Operating Conditions [1] "3.0 V DC supply voltage" and note 4 are new.	2-2
	The Table 2-4 • Overshoot and Undershoot Limits [1] table was updated.	2-3
	The Table 2-6 • Temperature and Voltage Derating Factors for Timing Delays table was updated.	2-5
	There are new parameters and data was updated in the Table 2-99 • RAM4K9 table.	2-76
	There are new parameters and data was updated in the Table 2-100 • RAM512X18 table.	2-77
Revision 8 (Feb 2008) Product Brief v1.1	Table 1-2 • ProASIC3E FPGAs Package Sizes Dimensions is new.	1-II
Revision 7 (Jun 2008) DC and Switching Characteristics v1.2	The title of Table 2-4 • Overshoot and Undershoot Limits [1] was modified to remove "as measured on quiet I/Os." Table note 2 was revised to remove "estimated SSO density over cycles." Table note 3 was deleted.	2-3
	Table 2-78 • LVDS Minimum and Maximum DC Input and Output Levels was updated.	2-50
Revision 6 (Jun 2008)	The A3PE600 "FG484" table was missing G22. The pin and its function were added to the table.	4-27
Revision 5 (Jun 2008) Packaging v1.4	The naming conventions changed for the following pins in the "FG484" for the A3PE600: **Pin Number** — **New Function Name** J19 — IO45PPB2V1 K20 — IO45NPB2V1 M2 — IO114NPB6V1 N1 — IO114PPB6V1 N4 — GFC2/IO115PPB6V1 P3 — IO115NPB6V1	4-22
Revision 4 (Apr 2008) Product Brief v1.0	The product brief portion of the datasheet was divided into two sections and given a version number, starting at v1.0. The first section of the document includes features, benefits, ordering information, and temperature and speed grade offerings. The second section is a device family overview.	N/A
Packaging v1.3	The "FG324" package diagram was replaced.	4-12

Revision	Changes	Page
Advance v0.5 (continued)	The "RESET" section was updated.	2-25
	The "RESET" section was updated.	2-27
	The "Introduction" of the "Introduction" section was updated.	2-28
	PCI-X 3.3 V was added to the Compatible Standards for 3.3 V in Table 2-11 • VCCI Voltages and Compatible Standards	2-29
	Table 2-35 • ProASIC3E I/O Features was updated.	2-54
	The "Double Data Rate (DDR) Support" section was updated to include information concerning implementation of the feature.	2-32
	The "Electrostatic Discharge (ESD) Protection" section was updated to include testing information.	2-35
	Level 3 and 4 descriptions were updated in Table 2-43 • I/O Hot-Swap and 5 V Input Tolerance Capabilities in ProASIC3 Devices.	2-64
	The notes in Table 2-45 • I/O Hot-Swap and 5 V Input Tolerance Capabilities in ProASIC3E Devices were updated.	2-64
	The "Simultaneous Switching Outputs (SSOs) and Printed Circuit Board Layout" section is new.	2-41
	A footnote was added to Table 2-37 • Maximum I/O Frequency for Single-Ended and Differential I/Os in All Banks in ProASIC3E Devices (maximum drive strength and high slew selected).	2-55
	Table 2-48 • ProASIC3E I/O Attributes vs. I/O Standard Applications	2-81
	Table 2-55 • ProASIC3 I/O Standards—SLEW and Output Drive (OUT_DRIVE) Settings	2-85
	The "x" was updated in the "Pin Descriptions" section.	2-50
	The "VCC Core Supply Voltage" pin description was updated.	2-50
	The "VMVx I/O Supply Voltage (quiet)" pin description was updated to include information concerning leaving the pin unconnected.	2-50
	EXTFB was removed from Figure 2-24 • ProASIC3E CCC Options.	2-24
	The CCC Output Peak-to-Peak Period Jitter F_{CCC_OUT} was updated in Table 2-13 • ProASIC3E CCC/PLL Specification.	2-30
	EXTFB was removed from Figure 2-27 • CCC/PLL Macro.	2-28
	The LVPECL specification in Table 2-45 • I/O Hot-Swap and 5 V Input Tolerance Capabilities in ProASIC3E Devices was updated.	2-64
	Table 2-15 • Levels of Hot-Swap Support was updated.	2-34
	The "Cold-Sparing Support" section was updated.	2-34
	"Electrostatic Discharge (ESD) Protection" section was updated.	2-35
	The VJTAG and I/O pin descriptions were updated in the "Pin Descriptions" section.	2-50
	The "VJTAG JTAG Supply Voltage" pin description was updated.	2-50
	The "VPUMP Programming Supply Voltage" pin description was updated to include information on what happens when the pin is tied to ground.	2-50

Datasheet Categories

Categories

In order to provide the latest information to designers, some datasheet parameters are published before data has been fully characterized from silicon devices. The data provided for a given device, as highlighted in the "ProASIC3E Device Status" table on page II, is designated as either "Product Brief," "Advance," "Preliminary," or "Production." The definitions of these categories are as follows:

Product Brief

The product brief is a summarized version of a datasheet (advance or production) and contains general product information. This document gives an overview of specific device and family information.

Advance

This version contains initial estimated information based on simulation, other products, devices, or speed grades. This information can be used as estimates, but not for production. This label only applies to the DC and Switching Characteristics chapter of the datasheet and will only be used when the data has not been fully characterized.

Preliminary

The datasheet contains information based on simulation and/or initial characterization. The information is believed to be correct, but changes are possible.

Production

This version contains information that is considered to be final.

Export Administration Regulations (EAR)

The products described in this document are subject to the Export Administration Regulations (EAR). They could require an approved export license prior to export from the United States. An export includes release of product or disclosure of technology to a foreign national inside or outside the United States.

Safety Critical, Life Support, and High-Reliability Applications Policy

The products described in this advance status document may not have completed the Microsemi qualification process. Products may be amended or enhanced during the product introduction and qualification process, resulting in changes in device functionality or performance. It is the responsibility of each customer to ensure the fitness of any product (but especially a new product) for a particular purpose, including appropriateness for safety-critical, life-support, and other high-reliability applications. Consult the Microsemi SoC Products Group Terms and Conditions for specific liability exclusions relating to life-support applications. A reliability report covering all of the SoC Products Group's products is available at *Microsemi SoC Reliability Report*. Microsemi also offers a variety of enhanced qualification and lot acceptance screening procedures. Contact your local sales office for additional reliability information.
