Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Power Calculation Methodology

This section describes a simplified method to estimate power consumption of an application. For more accurate and detailed power estimations, use the SmartPower tool in the Libero SoC software.

The power calculation methodology described below uses the following variables:

- The number of PLLs as well as the number and the frequency of each output clock generated
- The number of combinatorial and sequential cells used in the design
- The internal clock frequencies
- The number and the standard of I/O pins used in the design
- The number of RAM blocks used in the design
- Toggle rates of I/O pins as well as VersaTiles—guidelines are provided in Table 2-11 on page 2-11.
- Enable rates of output buffers—guidelines are provided for typical applications in Table 2-12 on page 2-11.
- Read rate and write rate to the memory—guidelines are provided for typical applications in Table 2-12 on page 2-11. The calculation should be repeated for each clock domain defined in the design.

Methodology

Total Power Consumption—P_{TOTAL}

$P_{TOTAL} = P_{STAT} + P_{DYN}$

P_{STAT} is the total static power consumption.

P_{DYN} is the total dynamic power consumption.

Total Static Power Consumption—P_{STAT}

$P_{STAT} = PDC1 + N_{INPUTS} * PDC2 + N_{OUTPUTS} * PDC3$

N_{INPUTS} is the number of I/O input buffers used in the design.

$N_{OUTPUTS}$ is the number of I/O output buffers used in the design.

Total Dynamic Power Consumption—P_{DYN}

$P_{DYN} = P_{CLOCK} + P_{S\text{-}CELL} + P_{C\text{-}CELL} + P_{NET} + P_{INPUTS} + P_{OUTPUTS} + P_{MEMORY} + P_{PLL}$

Global Clock Contribution—P_{CLOCK}

$P_{CLOCK} = (PAC1 + N_{SPINE} * PAC2 + N_{ROW} * PAC3 + N_{S\text{-}CELL} * PAC4) * F_{CLK}$

N_{SPINE} is the number of global spines used in the user design—guidelines are provided in the "Spine Architecture" section of the Global Resources chapter in the *ProASIC3E FPGA Fabric User's Guide*.

N_{ROW} is the number of VersaTile rows used in the design—guidelines are provided in the "Spine Architecture" section of the Global Resources chapter in the *ProASIC3E FPGA Fabric User's Guide*.

F_{CLK} is the global clock signal frequency.

$N_{S\text{-}CELL}$ is the number of VersaTiles used as sequential modules in the design.

PAC1, PAC2, PAC3, and PAC4 are device-dependent.

Sequential Cells Contribution—$P_{S\text{-}CELL}$

$P_{S\text{-}CELL} = N_{S\text{-}CELL} * (PAC5 + \alpha_1 / 2 * PAC6) * F_{CLK}$

$N_{S\text{-}CELL}$ is the number of VersaTiles used as sequential modules in the design. When a multi-tile sequential cell is used, it should be accounted for as 1.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in Table 2-11 on page 2-11.

F_{CLK} is the global clock signal frequency.

Guidelines

Toggle Rate Definition

A toggle rate defines the frequency of a net or logic element relative to a clock. It is a percentage. If the toggle rate of a net is 100%, this means that this net switches at half the clock frequency. Below are some examples:

- The average toggle rate of a shift register is 100% as all flip-flop outputs toggle at half of the clock frequency.
- The average toggle rate of an 8-bit counter is 25%:
  - Bit 0 (LSB) = 100%
  - Bit 1 = 50%
  - Bit 2 = 25%
  - …
  - Bit 7 (MSB) = 0.78125%
  - Average toggle rate = (100% + 50% + 25% + 12.5% + . . . + 0.78125%) / 8

Enable Rate Definition

Output enable rate is the average percentage of time during which tristate outputs are enabled. When nontristate output buffers are used, the enable rate should be 100%.

***Table 2-11* • Toggle Rate Guidelines Recommended for Power Calculation**

Component	Definition	Guideline
α_1	Toggle rate of VersaTile outputs	10%
α_2	I/O buffer toggle rate	10%

***Table 2-12* • Enable Rate Guidelines Recommended for Power Calculation**

Component	Definition	Guideline
β_1	I/O output buffer enable rate	100%
β_2	RAM enable rate for read operations	12.5%
β_3	RAM enable rate for write operations	12.5%

Revision	Changes	Page
Revision 10 (March 2012)	The "In-System Programming (ISP) and Security" section and "Security" section were revised to clarify that although no existing security measures can give an absolute guarantee, Microsemi FPGAs implement the best security available in the industry (SAR 34669).	I, 1-1
	The Y security option and Licensed DPA Logo were added to the "ProASIC3E Ordering Information" section. The trademarked Licensed DPA Logo identifies that a product is covered by a DPA counter-measures license from Cryptography Research (SAR 34727).	III
	The following sentence was removed from the "Advanced Architecture" section: "In addition, extensive on-chip programming circuitry allows for rapid, single-voltage (3.3 V) programming of IGLOOe devices via an IEEE 1532 JTAG interface" (SAR 34689).	1-3
	The "Specifying I/O States During Programming" section is new (SAR 34699).	1-6
	VCCPLL in Table 2-2 • Recommended Operating Conditions [1] was corrected from "1.4 to 1.6 V" to "1.425 to 1.575 V" (SAR 33851). The T_J symbol was added to the table and notes regarding T_A and T_J were removed. The second of two parameters in the VCCI and VMV row, called "3.3 V DC supply voltage," was corrected to "3.0 V DC supply voltage" (SAR 37227).	2-2
	The reference to guidelines for global spines and VersaTile rows, given in the "Global Clock Contribution—P_{CLOCK}" section, was corrected to the "Spine Architecture" section of the Global Resources chapter in the *ProASIC3E FPGA Fabric User's Guide* (SAR 34735).	2-9
	t_{DOUT} was corrected to t_{DIN} in Figure 2-3 • Input Buffer Timing Model and Delays (example) (SAR 37109).	2-13
	The typo related to the values for 3.3 V LVCMOS Wide Range in Table 2-17 • Summary of I/O Timing Characteristics—Software Default Settings was corrected (SAR 37227).	2-19
	The notes regarding drive strength in the "Summary of I/O Timing Characteristics – Default I/O Software Settings" section and "3.3 V LVCMOS Wide Range" section and tables were revised for clarification. They now state that the minimum drive strength for the default software configuration when run in wide range is ±100 µA. The drive strength displayed in software is supported in normal range only. For a detailed I/V curve, refer to the IBIS models (SAR 34763).	2-18, 2-27
