### **Understanding Embedded - FPGAs (Field Programmable Gate Array)**

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### **Applications of Embedded - FPGAs**

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

#### **Details**

|                                |   |
|--------------------------------|---|
| Product Status                 | Active  |
| Number of LABs/CLBs            | -   |
| Number of Logic Elements/Cells | -   |
| Total RAM Bits                 | 110592  |
| Number of I/O                  | 270   |
| Number of Gates                | 600000  |
| Voltage - Supply               | 1.425V ~ 1.575V   |
| Mounting Type                  | Surface Mount   |
| Operating Temperature          | -40°C ~ 100°C (TJ)  |
| Package / Case                 | 484-BGA   |
| Supplier Device Package        | 484-FPBGA (23x23)   |

## 2 – ProASIC3E DC and Switching Characteristics

### General Specifications

DC and switching characteristics for –F speed grade targets are based only on simulation.

The characteristics provided for the –F speed grade are subject to change after establishing FPGA specifications. Some restrictions might be added and will be reflected in future revisions of this document. The –F speed grade is only supported in the commercial temperature range.

### Operating Conditions

Stresses beyond those listed in Table 2-1 may cause permanent damage to the device.

Exposure to absolute maximum rating conditions for extended periods may affect device reliability. Absolute Maximum Ratings are stress ratings only; functional operation of the device at these or any other conditions beyond those listed under the Recommended Operating Conditions specified in Table 2-2 on page 2-2 is not implied.

**Table 2-1 • Absolute Maximum Ratings**

| Symbol                        | Parameter                           | Limits  | Units |
|-------------------------------|-------------------------------------|---|-------|
| VCC                           | DC core supply voltage              | –0.3 to 1.65  | V     |
| VJTAG                         | JTAG DC voltage                     | –0.3 to 3.75  | V     |
| VPUMP                         | Programming voltage                 | –0.3 to 3.75  | V     |
| VCCPLL                        | Analog power supply (PLL)           | –0.3 to 1.65  | V     |
| VCCI <sup>2</sup>             | DC I/O output buffer supply voltage | –0.3 to 3.75  | V     |
| VMV <sup>2</sup>              | DC I/O input buffer supply voltage  | –0.3 to 3.75  | V     |
| VI                            | I/O input voltage                   | –0.3 V to 3.6 V (when I/O hot insertion mode is enabled)<br>–0.3 V to (VCCI + 1 V) or 3.6 V, whichever voltage is lower (when I/O hot-insertion mode is disabled) | V     |
| T <sub>STG</sub> <sup>3</sup> | Storage temperature                 | –65 to +150   | °C    |
| T <sub>J</sub> <sup>3</sup>   | Junction temperature                | +125  | °C    |

**Notes:**

1. The device should be operated within the limits specified by the datasheet. During transitions, the input signal may undershoot or overshoot according to the limits shown in Table 2-3 on page 2-2.
2. VMV pins must be connected to the corresponding VCCI pins. See the "VMVx I/O Supply Voltage (quiet)" section on page 3-1 for further information.
3. For flash programming and retention maximum limits, refer to Table 2-3 on page 2-2, and for recommended operating limits, refer to Table 2-2 on page 2-2.

**Table 2-2 • Recommended Operating Conditions<sup>1</sup>**

| Symbol                    | Parameter                            |                               | Commercial     | Industrial     | Units |
|---------------------------|--------------------------------------|-------------------------------|----------------|----------------|-------|
| T <sub>A</sub>            | Ambient temperature                  |                               | 0 to +70       | -40 to +85     | °C    |
| T <sub>J</sub>            | Junction temperature                 |                               | 0 to +85       | -40 to +100    | °C    |
| VCC                       | 1.5 V DC core supply voltage         |                               | 1.425 to 1.575 | 1.425 to 1.575 | V     |
| VJTAG                     | JTAG DC voltage                      |                               | 1.4 to 3.6     | 1.4 to 3.6     | V     |
| VPUMP                     | Programming voltage                  | Programming Mode <sup>2</sup> | 3.15 to 3.45   | 3.15 to 3.45   | V     |
|                           |                                      | Operation <sup>3</sup>        | 0 to 3.6       | 0 to 3.6       | V     |
| VCCPLL                    | Analog power supply (PLL)            |                               | 1.425 to 1.575 | 1.425 to 1.575 | V     |
| VCCI and VMV <sup>4</sup> | 1.5 V DC supply voltage              |                               | 1.425 to 1.575 | 1.425 to 1.575 | V     |
|                           | 1.8 V DC supply voltage              |                               | 1.7 to 1.9     | 1.7 to 1.9     | V     |
|                           | 2.5 V DC supply voltage              |                               | 2.3 to 2.7     | 2.3 to 2.7     | V     |
|                           | 3.3 V DC supply voltage              |                               | 3.0 to 3.6     | 3.0 to 3.6     | V     |
|                           | 3.0 V DC supply voltage <sup>5</sup> |                               | 2.7 to 3.6     | 2.7 to 3.6     | V     |
|                           | LVDS/B-LVDS/M-LVDS differential I/O  |                               | 2.375 to 2.625 | 2.375 to 2.625 | V     |
|                           | LVPECL differential I/O              |                               | 3.0 to 3.6     | 3.0 to 3.6     | V     |

**Notes:**

1. All parameters representing voltages are measured with respect to GND unless otherwise specified.
2. The programming temperature range supported is T<sub>ambient</sub> = 0°C to 85°C.
3. VPUMP can be left floating during normal operation (not programming mode).
4. The ranges given here are for power supplies only. The recommended input voltage ranges specific to each I/O standard are given in Table 2-13 on page 2-16. VMV and VCCI should be at the same voltage within a given I/O bank. VMV pins must be connected to the corresponding VCCI pins. See the "VMVx I/O Supply Voltage (quiet)" section on page 3-1 for further information.
5. To ensure targeted reliability standards are met across ambient and junction operating temperatures, Microsemi recommends that the user follow best design practices using Microsemi's timing and power simulation tools.
6. 3.3 V wide range is compliant to the JESD8-B specification and supports 3.0 V VCCI operation.

**Table 2-3 • Flash Programming Limits – Retention, Storage and Operating Temperature<sup>1</sup>**

| Product Grade | Programming Cycles | Program Retention (biased/unbiased) | Maximum Storage Temperature T <sub>STG</sub> (°C) <sup>2</sup> | Maximum Operating Junction Temperature T <sub>J</sub> (°C) <sup>2</sup> |
|---------------|--------------------|-------------------------------------|--|---|
| Commercial    | 500                | 20 years                            | 110  | 100   |
| Industrial    | 500                | 20 years                            | 110  | 100   |

**Notes:**

1. This is a stress rating only; functional operation at any condition other than those indicated is not implied.
2. These limits apply for program/data retention only. Refer to Table 2-1 on page 2-1 and Table 2-2 for device operating conditions and absolute limits.

## Thermal Characteristics

### Introduction

The temperature variable in Designer software refers to the junction temperature, not the ambient temperature. This is an important distinction because dynamic and static power consumption cause the chip junction to be higher than the ambient temperature.

**EQ 1** can be used to calculate junction temperature.

$$T_J = \text{Junction Temperature} = \Delta T + T_A$$

EQ 1

where:

$T_A$  = Ambient Temperature

$\Delta T$  = Temperature gradient between junction (silicon) and ambient  $\Delta T = \theta_{ja} * P$

$\theta_{ja}$  = Junction-to-ambient of the package.  $\theta_{ja}$  numbers are located in [Table 2-5](#).

P = Power dissipation

### Package Thermal Characteristics

The device junction-to-case thermal resistivity is  $\theta_{jc}$  and the junction-to-ambient air thermal resistivity is  $\theta_{ja}$ . The thermal characteristics for  $\theta_{ja}$  are shown for two air flow rates. The absolute maximum junction temperature is 110°C. **EQ 2** shows a sample calculation of the absolute maximum power dissipation allowed for an 896-pin FBGA package at commercial temperature and in still air.

$$\text{Maximum Power Allowed} = \frac{\text{Max. junction temp. } (\text{°C}) - \text{Max. ambient temp. } (\text{°C})}{\theta_{ja} (\text{°C/W})} = \frac{110\text{°C} - 70\text{°C}}{13.6\text{°C/W}} = 5.88 \text{ W}$$

EQ 2

**Table 2-5 • Package Thermal Resistivities**

| Package Type   | Pin Count | $\theta_{jc}$ | $\theta_{ja}$ |              |              | Units |
|--|-----------|---------------|---------------|--------------|--------------|-------|
|  |           |               | Still Air     | 200 ft./min. | 500 ft./min. |       |
| Plastic Quad Flat Package (PQFP)   | 208       | 8.0           | 26.1          | 22.5         | 20.8         | C/W   |
| Plastic Quad Flat Package (PQFP) with embedded heat spreader in A3PE3000 | 208       | 3.8           | 16.2          | 13.3         | 11.9         | C/W   |
| Fine Pitch Ball Grid Array (FBGA)  | 256       | 3.8           | 26.9          | 22.8         | 21.5         | C/W   |
|  | 484       | 3.2           | 20.5          | 17.0         | 15.9         | C/W   |
|  | 676       | 3.2           | 16.4          | 13.0         | 12.0         | C/W   |
|  | 896       | 2.4           | 13.6          | 10.4         | 9.4          | C/W   |

### Temperature and Voltage Derating Factors

**Table 2-6 • Temperature and Voltage Derating Factors for Timing Delays  
(normalized to  $T_J = 70\text{°C}$ ,  $VCC = 1.425 \text{ V}$ )**

| Array Voltage<br>VCC (V) | Junction Temperature (°C) |      |      |      |      |       |
|--------------------------|---------------------------|------|------|------|------|-------|
|                          | -40°C                     | 0°C  | 25°C | 70°C | 85°C | 100°C |
| 1.425                    | 0.87                      | 0.92 | 0.95 | 1.00 | 1.02 | 1.04  |
| 1.500                    | 0.83                      | 0.88 | 0.90 | 0.95 | 0.97 | 0.98  |
| 1.575                    | 0.80                      | 0.85 | 0.87 | 0.92 | 0.93 | 0.95  |

**Table 2-9 • Summary of I/O Output Buffer Power (per pin) – Default I/O Software Settings (continued)**  
**(continued)<sup>1</sup>**

|  | C <sub>LOAD</sub> (pF) | VCCI (V) | Static Power PDC3 (mW) <sup>2</sup> | Dynamic Power PAC10 (μW/MHz) <sup>3</sup> |
|--|------------------------|----------|-------------------------------------|---|
| SSTL3 (I)  | 30                     | 3.3      | 26.02                               | 114.87                                    |
| SSTL3 (II)   | 30                     | 3.3      | 42.21                               | 131.76                                    |
| <b>Differential</b>  |                        |          |                                     |   |
| LVDS/B-LVDS/M-LVDS   | –                      | 2.5      | 7.70                                | 89.62                                     |
| LVPECL   | –                      | 3.3      | 19.42                               | 168.02                                    |
| <i>Notes:</i>  |                        |          |                                     |   |
| 1. Dynamic power consumption is given for standard load and software default drive strength and output slew.   |                        |          |                                     |   |
| 2. PDC3 is the static power (where applicable) measured on VCCI.   |                        |          |                                     |   |
| 3. PAC10 is the total dynamic power measured on VCC and VCCI.  |                        |          |                                     |   |
| 4. All LVCMOS 3.3 V software macros support LVCMOS 3.3 V wide range as specified in the JESD8-B specification. |                        |          |                                     |   |

## Power Consumption of Various Internal Resources

**Table 2-10 • Different Components Contributing to the Dynamic Power Consumption in ProASIC3E Devices**

| Parameter | Definition   | Device-Specific Dynamic Contributions (μW/MHz) |                            |          |
|-----------|--|--|----------------------------|----------|
|           |  | A3PE600  | A3PE1500                   | A3PE3000 |
| PAC1      | Clock contribution of a Global Rib                             | 12.77  | 16.21                      | 19.7     |
| PAC2      | Clock contribution of a Global Spine                           | 1.85   | 3.06                       | 4.16     |
| PAC3      | Clock contribution of a VersaTile row                          |  | 0.88                       |          |
| PAC4      | Clock contribution of a VersaTile used as a sequential module  |  | 0.12                       |          |
| PAC5      | First contribution of a VersaTile used as a sequential module  |  | 0.07                       |          |
| PAC6      | Second contribution of a VersaTile used as a sequential module |  | 0.29                       |          |
| PAC7      | Contribution of a VersaTile used as a combinatorial module     |  | 0.29                       |          |
| PAC8      | Average contribution of a routing net                          |  | 0.70                       |          |
| PAC9      | Contribution of an I/O input pin (standard-dependent)          |  | See Table 2-8 on page 2-6. |          |
| PAC10     | Contribution of an I/O output pin (standard-dependent)         |  | See Table 2-9 on page 2-7  |          |
| PAC11     | Average contribution of a RAM block during a read operation    |  | 25.00                      |          |
| PAC12     | Average contribution of a RAM block during a write operation   |  | 30.00                      |          |
| PAC13     | Static PLL contribution  |  | 2.55 mW                    |          |
| PAC14     | Dynamic contribution for PLL                                   |  | 2.60                       |          |

*Note:* For a different output load, drive strength, or slew rate, Microsemi recommends using the Microsemi power calculator or SmartPower in Libero SoC.

**Table 2-32 • 3.3 V LVC MOS Wide Range Low Slew**Commercial-Case Conditions:  $T_J = 70^\circ\text{C}$ , Worst-Case VCC = 1.425 V, Worst-Case VCCI = 2.7 V

**Notes:**

1. The minimum drive strength for any LVC MOS 3.3 V software configuration when run in wide range is  $\pm 100 \mu\text{A}$ . Drive strength displayed in the software is supported for normal range only. For a detailed I/V curve, refer to the IBIS models.
2. Software default selection highlighted in gray.
3. For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-5 for derating values.

2. For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-5 for derating values.

## 1.5 V LVCMOS (JESD8-11)

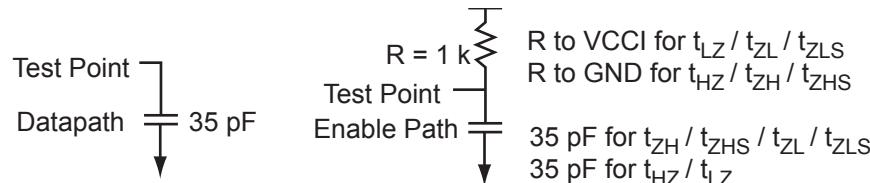

Low-Voltage CMOS for 1.5 V is an extension of the LVCMOS standard (JESD8-5) used for general-purpose 1.5 V applications. It uses a 1.5 V input buffer and a push-pull output buffer.

**Table 2-41 • Minimum and Maximum DC Input and Output Levels**

| 1.5 V<br>LVCMOS   | VIL       |             | VIH        |           | VOL         | VOH         | IOL | IOH | IOSL                    | IOSH                    | IIL <sup>1</sup> | IIH <sup>2</sup> |

**Notes:**

1. *IIL* is the input leakage current per I/O pin over recommended operation conditions where  $-0.3 \text{ V} < \text{VIN} < \text{VIL}$ .
2. *IIH* is the input leakage current per I/O pin over recommended operating conditions  $\text{VIH} < \text{VIN} < \text{VCCI}$ . Input current is larger when operating outside recommended ranges.
3. Currents are measured at high temperature (100°C junction temperature) and maximum voltage.
4. Currents are measured at 85°C junction temperature.
5. Software default selection highlighted in gray.

**Figure 2-10 • AC Loading**

**Table 2-42 • AC Waveforms, Measuring Points, and Capacitive Loads**

| Input Low (V) | Input High (V) | Measuring Point* (V) | VREF (typ.) (V) | C <sub>LOAD</sub> (pF) |
|---------------|----------------|----------------------|-----------------|------------------------|
| 0             | 1.5            | 0.75                 | -               | 35                     |

*Note:* \*Measuring point =  $V_{trip}$ . See [Table 2-15 on page 2-18](#) for a complete table of trip points.

**Note:** For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-5](#) for derating values.

## B-LVDS/M-LVDS

Bus LVDS (B-LVDS) and Multipoint LVDS (M-LVDS) specifications extend the existing LVDS standard to high-performance multipoint bus applications. Multidrop and multipoint bus configurations may contain any combination of drivers, receivers, and transceivers. Microsemi LVDS drivers provide the higher drive current required by B-LVDS and M-LVDS to accommodate the loading. The drivers require series terminations for better signal quality and to control voltage swing. Termination is also required at both ends of the bus since the driver can be located anywhere on the bus. These configurations can be implemented using the TRIBUF\_LVDS and BIBUF\_LVDS macros along with appropriate terminations. Multipoint designs using Microsemi LVDS macros can achieve up to 200 MHz with a maximum of 20 loads. A sample application is given in [Figure 2-23](#). The input and output buffer delays are available in the LVDS section in [Table 2-80](#).

Example: For a bus consisting of 20 equidistant loads, the following terminations provide the required differential voltage, in worst-case Industrial operating conditions, at the farthest receiver:  $R_S = 60 \Omega$  and  $R_T = 70 \Omega$ , given  $Z_0 = 50 \Omega$  (2") and  $Z_{\text{stub}} = 50 \Omega$  (~1.5").

**Notes:**

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
3. For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-5](#) for derating values.

**Table 2-97 • A3PE3000 Global Resource**Commercial-Case Conditions:  $T_J = 70^\circ\text{C}$ ,  $V_{CC} = 1.425 \text{ V}$ 

| Parameter     | Description                               | -2                |                   | -1                |                   | Std.              |                   | Units |
|---------------|---|-------------------|-------------------|-------------------|-------------------|-------------------|-------------------|-------|
|               |   | Min. <sup>1</sup> | Max. <sup>2</sup> | Min. <sup>1</sup> | Max. <sup>2</sup> | Min. <sup>1</sup> | Max. <sup>2</sup> |       |
| $t_{RCKL}$    | Input Low Delay for Global Clock          | 1.41              | 1.62              | 1.60              | 1.85              | 1.88              | 2.17              | ns    |
| $t_{RCKH}$    | Input High Delay for Global Clock         | 1.40              | 1.66              | 1.59              | 1.89              | 1.87              | 2.22              | ns    |
| $t_{RCKMPWH}$ | Minimum Pulse Width High for Global Clock | 0.75              |                   | 0.85              |                   | 1.00              |                   | ns    |
| $t_{RCKMPWL}$ | Minimum Pulse Width Low for Global Clock  | 0.85              |                   | 0.96              |                   | 1.13              |                   | ns    |
| $t_{RCKSW}$   | Maximum Skew for Global Clock             |                   | 0.26              |                   | 0.29              |                   | 0.35              | ns    |

**Notes:**

1. Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).
2. Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).
3. For specific junction temperature and voltage supply levels, refer to [Table 2-6 on page 2-5](#) for derating values.

| Advance v0.3<br>(continued) | The "Methodology" section was updated.             | 3-9  |
|                             | The A3PE3000 "208-Pin PQFP" pin table was updated. | 4-6  |

## Datasheet Categories

### **Categories**

In order to provide the latest information to designers, some datasheet parameters are published before data has been fully characterized from silicon devices. The data provided for a given device, as highlighted in the "[ProASIC3E Device Status](#)" table on page II, is designated as either "Product Brief," "Advance," "Preliminary," or "Production." The definitions of these categories are as follows:

#### **Product Brief**

The product brief is a summarized version of a datasheet (advance or production) and contains general product information. This document gives an overview of specific device and family information.

#### **Advance**

This version contains initial estimated information based on simulation, other products, devices, or speed grades. This information can be used as estimates, but not for production. This label only applies to the DC and Switching Characteristics chapter of the datasheet and will only be used when the data has not been fully characterized.

#### **Preliminary**

The datasheet contains information based on simulation and/or initial characterization. The information is believed to be correct, but changes are possible.

#### **Production**

This version contains information that is considered to be final.

### **Export Administration Regulations (EAR)**

The products described in this document are subject to the Export Administration Regulations (EAR). They could require an approved export license prior to export from the United States. An export includes release of product or disclosure of technology to a foreign national inside or outside the United States.

## **Safety Critical, Life Support, and High-Reliability Applications Policy**

The products described in this advance status document may not have completed the Microsemi qualification process. Products may be amended or enhanced during the product introduction and qualification process, resulting in changes in device functionality or performance. It is the responsibility of each customer to ensure the fitness of any product (but especially a new product) for a particular purpose, including appropriateness for safety-critical, life-support, and other high-reliability applications. Consult the Microsemi SoC Products Group Terms and Conditions for specific liability exclusions relating to life-support applications. A reliability report covering all of the SoC Products Group's products is available at [Microsemi SoC Reliability Report](#). Microsemi also offers a variety of enhanced qualification and lot acceptance screening procedures. Contact your local sales office for additional reliability information.
