Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Single Chip

Flash-based FPGAs store their configuration information in on-chip flash cells. Once programmed, the configuration data is an inherent part of the FPGA structure, and no external configuration data needs to be loaded at system power-up (unlike SRAM-based FPGAs). Therefore, flash-based ProASIC3E FPGAs do not require system configuration components such as EEPROMs or microcontrollers to load device configuration data. This reduces bill-of-materials costs and PCB area, and increases security and system reliability.

Instant On

Flash-based ProASIC3E devices support Level 0 of the Instant On classification standard. This feature helps in system component initialization, execution of critical tasks before the processor wakes up, setup and configuration of memory blocks, clock generation, and bus activity management. The Instant On feature of flash-based ProASIC3E devices greatly simplifies total system design and reduces total system cost, often eliminating the need for CPLDs and clock generation PLLs that are used for these purposes in a system. In addition, glitches and brownouts in system power will not corrupt the ProASIC3E device's flash configuration, and unlike SRAM-based FPGAs, the device will not have to be reloaded when system power is restored. This enables the reduction or complete removal of the configuration PROM, expensive voltage monitor, brownout detection, and clock generator devices from the PCB design. Flash-based ProASIC3E devices simplify total system design and reduce cost and design risk while increasing system reliability and improving system initialization time.

Firm Errors

Firm errors occur most commonly when high-energy neutrons, generated in the upper atmosphere, strike a configuration cell of an SRAM FPGA. The energy of the collision can change the state of the configuration cell and thus change the logic, routing, or I/O behavior in an unpredictable way. These errors are impossible to prevent in SRAM FPGAs. The consequence of this type of error can be a complete system failure. Firm errors do not exist in the configuration memory of ProASIC3E flash-based FPGAs. Once it is programmed, the flash cell configuration element of ProASIC3E FPGAs cannot be altered by high-energy neutrons and is therefore immune to them. Recoverable (or soft) errors occur in the user data SRAM of all FPGA devices. These can easily be mitigated by using error detection and correction (EDAC) circuitry built into the FPGA fabric.

Low Power

Flash-based ProASIC3E devices exhibit power characteristics similar to an ASIC, making them an ideal choice for power-sensitive applications. ProASIC3E devices have only a very limited power-on current surge and no high-current transition period, both of which occur on many FPGAs.

ProASIC3E devices also have low dynamic power consumption to further maximize power savings.

Advanced Flash Technology

The ProASIC3E family offers many benefits, including nonvolatility and reprogrammability through an advanced flash-based, 130-nm LVC MOS process with seven layers of metal. Standard CMOS design techniques are used to implement logic and control functions. The combination of fine granularity, enhanced flexible routing resources, and abundant flash switches allows for very high logic utilization without compromising device routability or performance. Logic functions within the device are interconnected through a four-level routing hierarchy.

Notes:

1. PDC2 is the static power (where applicable) measured on VMV.
2. PAC9 is the total dynamic power measured on VCC and VMV.
3. All LVC MOS 3.3 V software macros support LVC MOS 3.3 V wide range as specified in the JESD8b specification.

Combinatorial Cells Contribution— $P_{C\text{-CELL}}$

$$P_{C\text{-CELL}} = N_{C\text{-CELL}} * \alpha_1 / 2 * PAC7 * F_{CLK}$$

$N_{C\text{-CELL}}$ is the number of VersaTiles used as combinatorial modules in the design.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in [Table 2-11](#) on page 2-11.

F_{CLK} is the global clock signal frequency.

Routing Net Contribution— P_{NET}

$$P_{NET} = (N_{S\text{-CELL}} + N_{C\text{-CELL}}) * \alpha_1 / 2 * PAC8 * F_{CLK}$$

$N_{S\text{-CELL}}$ is the number of VersaTiles used as sequential modules in the design.

$N_{C\text{-CELL}}$ is the number of VersaTiles used as combinatorial modules in the design.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in [Table 2-11](#) on page 2-11.

F_{CLK} is the global clock signal frequency.

I/O Input Buffer Contribution— P_{INPUTS}

$$P_{INPUTS} = N_{INPUTS} * \alpha_2 / 2 * PAC9 * F_{CLK}$$

N_{INPUTS} is the number of I/O input buffers used in the design.

α_2 is the I/O buffer toggle rate—guidelines are provided in [Table 2-11](#) on page 2-11.

F_{CLK} is the global clock signal frequency.

I/O Output Buffer Contribution— $P_{OUTPUTS}$

$$P_{OUTPUTS} = N_{OUTPUTS} * \alpha_2 / 2 * \beta_1 * PAC10 * F_{CLK}$$

$N_{OUTPUTS}$ is the number of I/O output buffers used in the design.

α_2 is the I/O buffer toggle rate—guidelines are provided in [Table 2-11](#) on page 2-11.

β_1 is the I/O buffer enable rate—guidelines are provided in [Table 2-12](#) on page 2-11.

F_{CLK} is the global clock signal frequency.

RAM Contribution— P_{MEMORY}

$$P_{MEMORY} = PAC11 * N_{BLOCKS} * F_{READ-CLOCK} * \beta_2 + PAC12 * N_{BLOCK} * F_{WRITE-CLOCK} * \beta_3$$

N_{BLOCKS} is the number of RAM blocks used in the design.

$F_{READ-CLOCK}$ is the memory read clock frequency.

β_2 is the RAM enable rate for read operations—guidelines are provided in [Table 2-12](#) on page 2-11.

$F_{WRITE-CLOCK}$ is the memory write clock frequency.

β_3 is the RAM enable rate for write operations—guidelines are provided in [Table 2-12](#) on page 2-11.

PLL Contribution— P_{PLL}

$$P_{PLL} = PAC13 + PAC14 * F_{CLKOUT}$$

F_{CLKOUT} is the output clock frequency.¹

1. The PLL dynamic contribution depends on the input clock frequency, the number of output clock signals generated by the PLL, and the frequency of each output clock. If a PLL is used to generate more than one output clock, include each output clock in the formula by adding its corresponding contribution ($PAC14 * F_{CLKOUT}$ product) to the total PLL contribution.

Special Function Pins

NC**No Connect**

This pin is not connected to circuitry within the device. These pins can be driven to any voltage or can be left floating with no effect on the operation of the device.

DC**Do Not Connect**

This pin should not be connected to any signals on the PCB. These pins should be left unconnected.

Packaging

Semiconductor technology is constantly shrinking in size while growing in capability and functional integration. To enable next-generation silicon technologies, semiconductor packages have also evolved to provide improved performance and flexibility.

Microsemi consistently delivers packages that provide the necessary mechanical and environmental protection to ensure consistent reliability and performance. Microsemi IC packaging technology efficiently supports high-density FPGAs with large-pin-count Ball Grid Arrays (BGAs), but is also flexible enough to accommodate stringent form factor requirements for Chip Scale Packaging (CSP). In addition, Microsemi offers a variety of packages designed to meet your most demanding application and economic requirements for today's embedded and mobile systems.

Revision	Changes	Page														
Revision 9 (Aug 2009) Product Brief v1.2 DC and Switching Characteristics v1.3	All references to speed grade -F have been removed from this document.	N/A														
	The "Pro I/Os with Advanced I/O Standards" section was revised to add definitions of hot-swap and cold-sparing.	1-6														
	3.3 V LVC MOS and 1.2 V LVC MOS Wide Range support was added to the datasheet. This affects all tables that contained 3.3 V LVC MOS and 1.2 V LVC MOS data.	N/A														
	IIL and IIH input leakage current information was added to all "Minimum and Maximum DC Input and Output Levels" tables.	N/A														
	-F was removed from the datasheet. The speed grade is no longer supported.	N/A														
	In the Table 2-2 • Recommended Operating Conditions ¹ "3.0 V DC supply voltage" and note 4 are new.	2-2														
	The Table 2-4 • Overshoot and Undershoot Limits ¹ table was updated.	2-3														
	The Table 2-6 • Temperature and Voltage Derating Factors for Timing Delays table was updated.	2-5														
	There are new parameters and data was updated in the Table 2-99 • RAM4K9 table.	2-76														
	There are new parameters and data was updated in the Table 2-100 • RAM512X18 table.	2-77														
Revision 8 (Feb 2008) Product Brief v1.1	Table 1-2 • ProASIC3E FPGAs Package Sizes Dimensions is new.	1-II														
Revision 7 (Jun 2008) DC and Switching Characteristics v1.2	The title of Table 2-4 • Overshoot and Undershoot Limits ¹ was modified to remove "as measured on quiet I/Os." Table note 2 was revised to remove "estimated SSO density over cycles." Table note 3 was deleted.	2-3														
	Table 2-78 • LVDS Minimum and Maximum DC Input and Output Levels was updated.	2-50														
Revision 6 (Jun 2008)	The A3PE600 " FG484 " table was missing G22. The pin and its function were added to the table.	4-27														
Revision 5 (Jun 2008) Packaging v1.4	The naming conventions changed for the following pins in the " FG484 " for the A3PE600: <table> <thead> <tr> <th>Pin Number</th> <th>New Function Name</th> </tr> </thead> <tbody> <tr> <td>J19</td> <td>IO45PPB2V1</td> </tr> <tr> <td>K20</td> <td>IO45NPB2V1</td> </tr> <tr> <td>M2</td> <td>IO114NPB6V1</td> </tr> <tr> <td>N1</td> <td>IO114PPB6V1</td> </tr> <tr> <td>N4</td> <td>GFC2/IO115PPB6V1</td> </tr> <tr> <td>P3</td> <td>IO115NPB6V1</td> </tr> </tbody> </table>	Pin Number	New Function Name	J19	IO45PPB2V1	K20	IO45NPB2V1	M2	IO114NPB6V1	N1	IO114PPB6V1	N4	GFC2/IO115PPB6V1	P3	IO115NPB6V1	4-22

Revision 4 (Apr 2008) Product Brief v1.0 Packaging v1.3	The product brief portion of the datasheet was divided into two sections and given a version number, starting at v1.0. The first section of the document includes features, benefits, ordering information, and temperature and speed grade offerings. The second section is a device family overview.	N/A														
	The " FG324 " package diagram was replaced.	4-12
