### Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

#### Details

Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	36864
Number of I/O	71
Number of Gates	125000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-20°C ~ 85°C (TJ)
Package / Case	100-TQFP
Supplier Device Package	100-VQFP (14x14)
Purchase URL	<a href="https://www.e-xfl.com/product-detail/microchip-technology/a3pn125-1vq100">https://www.e-xfl.com/product-detail/microchip-technology/a3pn125-1vq100</a>

Table 2-4 shows the current draw in Sleep mode for an A3P250 device with the following test conditions: VCCI = VMV; VCC = VJTAG = VPUMP = GND.

**Table 2-4 • A3P250 Current Draw in Sleep Mode**

Typical Conditions	A3P250	
	I <sub>CCI</sub> (μA)	I <sub>CCI</sub> (μA) per Bank
VCCI = 3.3 V	31.57	7.89
VCCI = 2.5 V	23.96	5.99
VCCI = 1.8 V	17.32	4.33
VCCI = 1.5 V	14.46	3.62
I <sub>CC</sub> FPGA Core	0.0	0.0
Leakage Current per I/O	0.1	0.1
VPUMP	0.0	0.0

*Note: The data in this table were taken under typical conditions and are based on characterization. The data is not guaranteed.*

Table 2-5 shows the current draw in Sleep mode for an A3PE600 device with the following test conditions: VCCI = VMV; VCC = VJTAG = VPUMP = GND.

**Table 2-5 • A3PE600 Current Draw in Sleep Mode**

Typical Conditions	A3PE600	
	I <sub>CCI</sub> (μA)	I <sub>CCI</sub> (μA) per Bank
VCCI = 3.3 V	59.85	7.48
VCCI = 2.5 V	45.50	5.69
VCCI = 1.8 V	32.98	4.12
VCCI = 1.5 V	27.66	3.46
VCCI = 0 V or Floating	0.0	0.0
I <sub>CC</sub> FPGA Core	0.0	0.0
Leakage Current per I/O	0.1	0.1
I <sub>PUMP</sub>	0.0	0.0

*Note: The data in this table were taken under typical conditions and are based on characterization. The data is not guaranteed.*

ProASIC3/E and ProASIC3 nano devices were designed such that before device power-up, all I/Os are in tristate mode. The I/Os will remain tristated during power-up until the last voltage supply (VCC or VCCI) is powered to its functional level. After the last supply reaches the functional level, the outputs will exit the tristate mode and drive the logic at the input of the output buffer. The behavior of user I/Os is independent of the VCC and VCCI sequence or the state of other FPGA voltage supplies (VPUMP and VJTAG). During power-down, device I/Os become tristated once the first power supply (VCC or VCCI) drops below its brownout voltage level. The I/O behavior during power-down is also independent of voltage supply sequencing.

Figure 2-5 on page 27 shows a timing diagram for the FPGA core entering the activation and deactivation trip points for a typical application when the VCC power supply ramp rate is 100 μs (ramping from 0 V to 1.5 V). This is, in fact, the timing diagram for the FPGA entering and exiting Sleep mode, as it is dependent on powering down or powering up VCC. Depending on the ramp rate of the power supply and board-level configurations, the user can easily calculate how long it takes for the core to become active or inactive. For more information, refer to the "Power-Up/-Down Behavior of Low Power Flash Devices" section on page 307.

## Chip and Quadrant Global I/Os

The following sections give an overview of naming conventions and other related I/O information.

### Naming of Global I/Os

In low power flash devices, the global I/Os have access to certain clock conditioning circuitry and have direct access to the global network. Additionally, the global I/Os can be used as regular I/Os, since they have identical capabilities to those of regular I/Os. Due to the comprehensive and flexible nature of the I/Os in low power flash devices, a naming scheme is used to show the details of the I/O. The global I/O uses the generic name Gmn/IOuxwByVz. Note that Gmn refers to a global input pin and IOuxwByVz refers to a regular I/O Pin, as these I/Os can be used as either global or regular I/Os. Refer to the I/O Structures chapter of the user's guide for the device that you are using for more information on this naming convention.

Figure 3-4 represents the global input pins connection. It shows all 54 global pins available to access the 18 global networks in ProASIC3E families.

Figure 3-4 • Global Connections Details

You can control the maximum number of shared instances allowed for the legalization to take place using the Compile Option dialog box shown in Figure 3-17. Refer to Libero SoC / Designer online help for details on the Compile Option dialog box. A large number of shared instances most likely indicates a floorplanning problem that you should address.

---

---

**Figure 3-17 • Shared Instances in the Compile Option Dialog Box**

## Designer Flow for Global Assignment

To achieve the desired result, pay special attention to global management during synthesis and place-and-route. The current Synplify tool does not insert more than six global buffers in the netlist by default. Thus, the default flow will not assign any signal to the quadrant global network. However, you can use attributes in Synplify and increase the default global macro assignment in the netlist. Designer v6.2 supports automatic quadrant global assignment, which was not available in Designer v6.1. Layout will make the choice to assign the correct signals to global. However, you can also utilize PDC and perform manual global assignment to overwrite any automatic assignment. The following step-by-step suggestions guide you in the layout of your design and help you improve timing in Designer:

1. Run Compile and check the Compile report. The Compile report has global information in the "Device Utilization" section that describes the number of chip and quadrant signals in the design. A "Net Report" section describes chip global nets, quadrant global nets, local clock nets, a list of nets listed by fanout, and net candidates for local clock assignment. Review this information. Note that YB or YC are counted as global only when they are used in isolation; if you use YB only and not GLB, this net is not shown in the global/quadrant nets report. Instead, it appears in the Global Utilization report.
2. If some signals have a very high fanout and are candidates for global promotion, promote those signals to global using the compile options or PDC commands. Figure 3-18 on page 54 shows the Globals Management section of the compile options. Select **Promote regular nets whose fanout is greater than** and enter a reasonable value for fanouts.

## Step 1

Run Synthesis with default options. The Synplicity log shows the following device utilization:

Cell usage:

	cell count	area	count*area
DFN1E1C1	1536	2.0	3072.0
BUFF	278	1.0	278.0
INBUF	10	0.0	0.0
VCC	9	0.0	0.0
GND	9	0.0	0.0
OUTBUF	6	0.0	0.0
CLKBUF	3	0.0	0.0
PLL	2	0.0	0.0
TOTAL	1853		3350.0

## Step 2

Run Compile with the **Promote regular nets whose fanout is greater than** option selected in Designer; you will see the following in the Compile report:

Device utilization report:

```
=====
CORE                Used:   1536  Total:  13824  (11.11%)
IO (W/ clocks)      Used:    19   Total:   147   (12.93%)
Differential IO      Used:     0   Total:    65   (0.00%)
GLOBAL              Used:     8   Total:    18   (44.44%)
PLL                  Used:     2   Total:     2  (100.00%)
RAM/FIFO             Used:     0   Total:    24   (0.00%)
FlashROM             Used:     0   Total:     1   (0.00%)
=====
```

The following nets have been assigned to a global resource:

Fanout	Type	Name
1536	INT_NET	Net : EN_ALL_c Driver: EN_ALL_pad_CLKINT Source: AUTO PROMOTED
1536	SET/RESET_NET	Net : ACLR_c Driver: ACLR_pad_CLKINT Source: AUTO PROMOTED
256	CLK_NET	Net : QCLK1_c Driver: QCLK1_pad_CLKINT Source: AUTO PROMOTED
256	CLK_NET	Net : QCLK2_c Driver: QCLK2_pad_CLKINT Source: AUTO PROMOTED
256	CLK_NET	Net : QCLK3_c Driver: QCLK3_pad_CLKINT Source: AUTO PROMOTED
256	CLK_NET	Net : \$1N14 Driver: \$1I5/Core Source: ESSENTIAL
256	CLK_NET	Net : \$1N12 Driver: \$1I6/Core Source: ESSENTIAL
256	CLK_NET	Net : \$1N10 Driver: \$1I6/Core Source: ESSENTIAL

Designer will promote five more signals to global due to high fanout. There are eight signals assigned to global networks.

Date	Changes	Page
v1.2 (June 2008)	The following changes were made to the family descriptions in Figure 4-1 • Overview of the CCCs Offered in Fusion, IGLOO, and ProASIC3: <ul style="list-style-type: none"> <li>• ProASIC3L was updated to include 1.5 V.</li> <li>• The number of PLLs for ProASIC3E was changed from five to six.</li> </ul>	61
v1.1 (March 2008)	Table 4-1 • Flash-Based FPGAs and the associated text were updated to include the IGLOO PLUS family. The "IGLOO Terminology" section and "ProASIC3 Terminology" section are new.	63
	The "Global Input Selections" section was updated to include 15 k gate devices as supported I/O types for globals, for CCC only.	71
	Table 4-5 • Number of CCCs by Device Size and Package was revised to include ProASIC3L, IGLOO PLUS, A3P015, AGL015, AGLP030, AGLP060, and AGLP125.	78
	The "IGLOO and ProASIC3 CCC Locations" section was revised to include 15 k gate devices in the exception statements, as they do not contain PLLs.	81
v1.0 (January 2008)	Information about unlocking the PLL was removed from the "Dynamic PLL Configuration" section.	87
	In the "Dynamic PLL Configuration" section, information was added about running Layout and determining the exact setting of the ports.	100
	In Table 4-8 • Configuration Bit Descriptions for the CCC Blocks, the following bits were updated to delete "transport to the user" and reference the footnote at the bottom of the table: 79 to 71.	90

**Notes:**

1. Automotive ProASIC3 devices restrict RAM4K9 to a single port or to dual ports with the same clock 180° out of phase (inverted) between clock pins. In single-port mode, inputs to port B should be tied to ground to prevent errors during compile. This warning applies only to automotive ProASIC3 parts of certain revisions and earlier. Contact Technical Support at [soc\\_tech@microsemi.com](mailto:soc_tech@microsemi.com) for information on the revision number for a particular lot and date code.
2. For FIFO4K18, the same clock 180° out of phase (inverted) between clock pins should be used.

**Figure 6-3 • Supported Basic RAM Macros**

## SRAM Features

### RAM4K9 Macro

RAM4K9 is the dual-port configuration of the RAM block (Figure 6-4). The RAM4K9 nomenclature refers to both the deepest possible configuration and the widest possible configuration the dual-port RAM block can assume, and does not denote a possible memory aspect ratio. The RAM block can be configured to the following aspect ratios: 4,096×1, 2,048×2, 1,024×4, and 512×9. RAM4K9 is fully synchronous and has the following features:

- Two ports that allow fully independent reads and writes at different frequencies
- Selectable pipelined or nonpipelined read
- Active-low block enables for each port
- Toggle control between read and write mode for each port
- Active-low asynchronous reset
- Pass-through write data or hold existing data on output. In pass-through mode, the data written to the write port will immediately appear on the read port.
- Designer software will automatically facilitate falling-edge clocks by bubble-pushing the inversion to previous stages.

*Note: For timing diagrams of the RAM signals, refer to the appropriate family datasheet.*

**Figure 6-4 • RAM4K9 Simplified Configuration**

### Signal Descriptions for RAM4K9

**Note:** Automotive ProASIC3 devices support single-port SRAM capabilities, or dual-port SRAM only under specific conditions. Dual-port mode is supported if the clocks to the two SRAM ports are the same and 180° out of phase (i.e., the port A clock is the inverse of the port B clock). Since Libero SoC macro libraries support a dual-port macro only, certain modifications must be made. These are detailed below.

The following signals are used to configure the RAM4K9 memory element:

#### **WIDTHA and WIDTHB**

These signals enable the RAM to be configured in one of four allowable aspect ratios (Table 6-2 on page 138).

**Note:** When using the SRAM in single-port mode for Automotive ProASIC3 devices, WIDTHB should be tied to ground.

## List of Changes

The following table lists critical changes that were made in each revision of the document.

Date	Changes	Page
August 2012	The notes in Table 8-2 • Designer State (resulting from I/O attribute modification) were revised to clarify which device families support programmable input delay (SAR 39666).	187
June 2011	Figure 8-2 • SmartGen Catalog was updated (SAR 24310). Figure 8-3 • Expanded I/O Section and the step associated with it were deleted to reflect changes in the software.	188
	The following rule was added to the "VREF Rules for the Implementation of Voltage-Referenced I/O Standards" section: Only minibanks that contain input or bidirectional I/Os require a VREF. A VREF is not needed for minibanks composed of output or tristated I/Os (SAR 24310).	199
July 2010	Notes were added where appropriate to point out that IGLOO nano and ProASIC3 nano devices do not support differential inputs (SAR 21449).	N/A
v1.4 (December 2008)	IGLOO nano and ProASIC3 nano devices were added to Table 8-1 • Flash-Based FPGAs.	186
	The notes for Table 8-2 • Designer State (resulting from I/O attribute modification) were revised to indicate that skew control and input delay do not apply to nano devices.	187
v1.3 (October 2008)	The "Flash FPGAs I/O Support" section was revised to include new families and make the information more concise.	186
v1.2 (June 2008)	The following changes were made to the family descriptions in Table 8-1 • Flash-Based FPGAs: <ul style="list-style-type: none"> <li>ProASIC3L was updated to include 1.5 V.</li> <li>The number of PLLs for ProASIC3E was changed from five to six.</li> </ul>	186
v1.1 (March 2008)	This document was previously part of the <i>I/O Structures in IGLOO and ProASIC3 Devices</i> document. The content was separated and made into a new document.	N/A
	Table 8-2 • Designer State (resulting from I/O attribute modification) was updated to include note 2 for IGLOO PLUS.	187

## DDR Input Register

**Figure 9-5 • DDR Input Register (SSTL2 Class I)**

The corresponding structural representations, as generated by SmartGen, are shown below:

### Verilog

```

module DDR_InBuf_SSTL2_I (PAD, CLR, CLK, QR, QF);

input  PAD, CLR, CLK;
output QR, QF;

wire Y;

    INBUF_SSTL2_I INBUF_SSTL2_I_0_inst(.PAD(PAD),.Y(Y));
    DDR_REG DDR_REG_0_inst(.D(Y),.CLK(CLK),.CLR(CLR),.QR(QR),.QF(QF));

endmodule
  
```

### VHDL

```

library ieee;
use ieee.std_logic_1164.all;
--The correct library will be inserted automatically by SmartGen
library proasic3; use proasic3.all;
--library fusion; use fusion.all;
--library igloo; use igloo.all;

entity DDR_InBuf_SSTL2_I is
    port(PAD, CLR, CLK : in std_logic;  QR, QF : out std_logic) ;
end DDR_InBuf_SSTL2_I;

architecture DEF_ARCH of  DDR_InBuf_SSTL2_I is

    component INBUF_SSTL2_I
        port(PAD : in std_logic := 'U'; Y : out std_logic) ;
    end component;

    component DDR_REG
        port(D, CLK, CLR : in std_logic := 'U'; QR, QF : out std_logic) ;
    end component;

    signal Y : std_logic ;

begin

    INBUF_SSTL2_I_0_inst : INBUF_SSTL2_I
    port map(PAD => PAD, Y => Y);
    DDR_REG_0_inst : DDR_REG
    port map(D => Y, CLK => CLK, CLR => CLR, QR => QR, QF => QF);

end DEF_ARCH;
  
```

## DDR Output Register

**Figure 9-6 • DDR Output Register (SSTL3 Class I)**

### Verilog

```

module DDR_OutBuf_SSTL3_I(DataR,DataF,CLR,CLK,PAD);

input  DataR, DataF, CLR, CLK;
output PAD;

wire Q, VCC;

    VCC VCC_1_net(.Y(VCC));
    DDR_OUT DDR_OUT_0_inst(.DR(DataR),.DF(DataF),.CLK(CLK),.CLR(CLR),.Q(Q));
    OUTBUF_SSTL3_I OUTBUF_SSTL3_I_0_inst(.D(Q),.PAD(PAD));

endmodule

```

### VHDL

        port(D : in std_logic := 'U'; PAD : out std_logic) ;
    end component;

    component VCC
        port( Y : out std_logic);
    end component;

    signal Q, VCC_1_net : std_logic ;

begin

    VCC_2_net : VCC port map(Y => VCC_1_net);
    DDR_OUT_0_inst : DDR_OUT
        port map(DR => DataR, DF => DataF, CLK => CLK, CLR => CLR, Q => Q);
    OUTBUF_SSTL3_I_0_inst : OUTBUF_SSTL3_I
        port map(D => Q, PAD => PAD);

end DEF_ARCH;

```

## List of Changes

The following table lists critical changes that were made in each revision of the chapter.

Date	Changes	Page
July 2010	FlashPro4 is a replacement for FlashPro3 and has been added to this chapter. FlashPro is no longer available.	N/A
	The chapter was updated to include SmartFusion devices.	N/A
	The following were deleted: "Live at Power-Up (LAPU) or Boot PROM" section "Design Security" section Table 14-2 • Programming Features for Actel Devices and much of the text in the "Programming Features for Microsemi Devices" section "Programming Flash FPGAs" section "Return Material Authorization (RMA) Policies" section	N/A
	The "Device Programmers" section was revised.	225
	The Independent Programming Centers information was removed from the "Volume Programming Services" section.	226
	Table 10-3 • Programming Solutions was revised to add FlashPro4 and note that FlashPro is discontinued. A note was added for FlashPro Lite regarding power supply requirements.	227
	Most items were removed from Table 10-4 • Programming Ordering Codes, including FlashPro3 and FlashPro.	228
	The "Programmer Device Support" section was deleted and replaced with a reference to the Microsemi SoC Products Group website for the latest information.	228
	The "Certified Programming Solutions" section was revised to add FlashPro4 and remove Silicon Sculptor I and Silicon Sculptor 6X. Reference to <i>Programming and Functional Failure Guidelines</i> was added.	228
	The file type *.pdb was added to the "Use the Latest Version of the Designer Software to Generate Your Programming File (recommended)" section.	229
	Instructions on cleaning and careful insertion were added to the "Perform Routine Hardware Self-Diagnostic Test" section. Information was added regarding testing Silicon Sculptor programmers with an adapter module installed before every programming session verifying their calibration annually.	229
	The "Signal Integrity While Using ISP" section is new.	230
	The "Programming Failure Allowances" section was revised.	230

3. Choose the desired settings for the FlashROM configurations to be programmed (Figure 11-13). Click **Finish** to generate the STAPL programming file for the design.
- 

**Figure 11-13 • FlashROM Configuration Settings for Low Power Flash Devices**

## Generation of Security Header Programming File Only— Application 2

As mentioned in the "Application 2: Nontrusted Environment—Unsecured Location" section on page 243, the designer may employ FlashLock Pass Key protection or FlashLock Pass Key with AES encryption on the device before sending it to a nontrusted or unsecured location for device programming. To achieve this, the user needs to generate a programming file containing only the security settings desired (Security Header programming file).

Note: If AES encryption is configured, FlashLock Pass Key protection must also be configured.

The available security options are indicated in Table 11-4 and Table 11-5 on page 251.

**Table 11-4 • FlashLock Security Options for IGLOO and ProASIC3**

Security Option	FlashROM Only	FPGA Core Only	Both FlashROM and FPGA
No AES / no FlashLock	—	—	—
FlashLock only	✓	✓	✓
AES and FlashLock	✓	✓	✓

*Note: The settings in this figure are used to show the generation of an AES-encrypted programming file for the FPGA array, FlashROM, and FB contents. One or all locations may be selected for encryption.*

---

**Figure 11-17 • Settings to Program a Device Secured with FlashLock and using AES Encryption**

Choose the **High** security level to reprogram devices using both the FlashLock Pass Key and AES key protection (Figure 11-18 on page 255). Enter the AES key and click **Next**.

A device that has already been secured with FlashLock and has an AES key loaded must recognize the AES key to program the device and generate a valid bitstream in authentication. The FlashLock Key is only required to unlock the device and change the security settings.

This is what makes it possible to program in an untrusted environment. The AES key is protected inside the device by the FlashLock Key, so you can only program if you have the correct AES key. In fact, the AES key is not in the programming file either. It is the key used to encrypt the data in the file. The same key previously programmed with the FlashLock Key matches to decrypt the file.

An AES-encrypted file programmed to a device without FlashLock would not be secure, since without FlashLock to protect the AES key, someone could simply reprogram the AES key first, then program with any AES key desired or no AES key at all. This option is therefore not available in the software.

---

**Figure 11-19 • FlashLock Pass Key, Previously Programmed Devices**

It is important to note that when the security settings need to be updated, the user also needs to select the **Security settings** check box in Step 1, as shown in Figure 11-10 on page 248 and Figure 11-11 on page 248, to modify the security settings. The user must consider the following:

- If only a new AES key is necessary, the user must re-enter the same Pass Key previously programmed into the device in Designer and then generate a programming file with the same Pass Key and a different AES key. This ensures the programming file can be used to access and program the device and the new AES key.
- If a new Pass Key is necessary, the user can generate a new programming file with a new Pass Key (with the same or a new AES key if desired). However, for programming, the user must first load the original programming file with the Pass Key that was previously used to unlock the device. Then the new programming file can be used to program the new security settings.

## Advanced Options

As mentioned, there may be applications where more complicated security settings are required. The “Custom Security Levels” section in the *FlashPro User's Guide* describes different advanced options available to aid the user in obtaining the best available security settings.

## Programming File Header Definition

In each STAPL programming file generated, there will be information about how the AES key and FlashLock Pass Key are configured. Table 11-8 shows the header definitions in STAPL programming files for different security levels.

**Table 11-8 • STAPL Programming File Header Definitions by Security Level**

Security Level	STAPL File Header Definition
No security (no FlashLock Pass Key or AES key)	NOTE "SECURITY" "Disable";
FlashLock Pass Key with no AES key	NOTE "SECURITY" "KEYED ";
FlashLock Pass Key with AES key	NOTE "SECURITY" "KEYED ENCRYPT ";
Permanent Security Settings option enabled	NOTE "SECURITY" "PERMLOCK ENCRYPT ";
AES-encrypted FPGA array (for programming updates)	NOTE "SECURITY" "ENCRYPT CORE ";
AES-encrypted FlashROM (for programming updates)	NOTE "SECURITY" "ENCRYPT FROM ";
AES-encrypted FPGA array and FlashROM (for programming updates)	NOTE "SECURITY" "ENCRYPT FROM CORE ";

### Example File Headers

#### STAPL Files Generated with FlashLock Key and AES Key Containing Key Information

- FlashLock Key / AES key indicated in STAPL file header definition
- Intended ONLY for secured/trusted environment programming applications

## Microsemi's Flash Families Support Voltage Switching Circuit

The flash FPGAs listed in Table 13-1 support the voltage switching circuit feature and the functions described in this document.

**Table 13-1 • Flash-Based FPGAs Supporting Voltage Switching Circuit**

Series	Family*	Description
IGLOO	IGLOO	Ultra-low power 1.2 V to 1.5 V FPGAs with Flash*Freeze technology
	IGLOOe	Higher density IGLOO FPGAs with six PLLs and additional I/O standards
	IGLOO nano	The industry's lowest-power, smallest-size solution
	IGLOO PLUS	IGLOO FPGAs with enhanced I/O capabilities
ProASIC3	ProASIC3L	ProASIC3 FPGAs supporting 1.2 V to 1.5 V with Flash*Freeze technology
	RT ProASIC3	Radiation-tolerant RT3PE600L and RT3PE3000L
	Military ProASIC3/EL	Military temperature A3PE600L, A3P1000, and A3PE3000L

Note: \*The device names link to the appropriate datasheet, including product brief, DC and switching characteristics, and packaging information.

### **IGLOO Terminology**

In documentation, the terms IGLOO series and IGLOO devices refer to all of the IGLOO devices as listed in Table 13-1. Where the information applies to only one product line or limited devices, these exclusions will be explicitly stated.

### **ProASIC3 Terminology**

In documentation, the terms ProASIC3 series and ProASIC3 devices refer to all of the ProASIC3 devices as listed in Table 13-1. Where the information applies to only one product line or limited devices, these exclusions will be explicitly stated.

To further understand the differences between the IGLOO and ProASIC3 devices, refer to the *Industry's Lowest Power FPGAs Portfolio*.

## Conclusion

Microsemi low power flash FPGAs offer many unique advantages, such as security, nonvolatility, reprogrammability, and low power—all in a single chip. In addition, Fusion, IGLOO, and ProASIC3 devices provide access to the JTAG port from core VersaTiles while the device is in normal operating mode. A wide range of available user-defined JTAG opcodes allows users to implement various types of applications, exploiting this feature of these devices. The connection between the JTAG port and core tiles is implemented through an embedded and hardwired UJTAG tile. A UJTAG tile can be instantiated in designs using the UJTAG library cell. This document presents multiple examples of UJTAG applications, such as dynamic reconfiguration, silicon test and debug, fine-tuning of the design, and RAM initialization. Each of these applications offers many useful advantages.

## List of Changes

The following table lists critical changes that were made in each revision of the chapter.

Date	Changes	Page
December 2011	Information on the drive strength and slew rate of TDO pins was added to the "Silicon Testing and Debugging" section (SAR 31749).	304
July 2010	This chapter is no longer published separately with its own part number and version but is now part of several FPGA fabric user's guides.	N/A
v1.4 (December 2008)	IGLOO nano and ProASIC3 nano devices were added to Table 16-1 • Flash-Based FPGAs.	298
v1.3 (October 2008)	The "UJTAG Support in Flash-Based Devices" section was revised to include new families and make the information more concise.	298
	The title of Table 16-3 • Configuration Bits of Fusion, IGLOO, and ProASIC3 CCC Blocks was revised to include Fusion.	302
v1.2 (June 2008)	The following changes were made to the family descriptions in Table 16-1 • Flash-Based FPGAs: <ul style="list-style-type: none"> <li>ProASIC3L was updated to include 1.5 V.</li> <li>The number of PLLs for ProASIC3E was changed from five to six.</li> </ul>	298
v1.1 (March 2008)	The chapter was updated to include the IGLOO PLUS family and information regarding 15 k gate devices.	N/A
	The "IGLOO Terminology" section and "ProASIC3 Terminology" section are new.	298

## Transient Current on VCC

The characterization of the transient current on VCC is performed on nearly all devices within the IGLOO, ProASIC3L, and ProASIC3 families. A sample size of five units is used from each device family member. All the device I/Os are internally pulled down while the transient current measurements are performed. For ProASIC3 devices, the measurements at typical conditions show that the maximum transient current on VCC, when the power supply is powered at ramp-rates ranging from 15 V/ms to 0.15 V/ms, does not exceed the maximum standby current specified in the device datasheets. Refer to the DC and Switching Characteristics chapters of the *ProASIC3 Flash Family FPGAS* datasheet and *ProASIC3E Flash Family FPGAs* datasheet for more information.

Similarly, IGLOO, IGLOO nano, IGLOO PLUS, and ProASIC3L devices exhibit very low transient current on VCC. The transient current does not exceed the typical operating current of the device while in active mode. For example, the characterization of AGL600-FG256 V2 and V5 devices has shown that the transient current on VCC is typically in the range of 1–5 mA.

## Transient Current on VCCI

The characterization of the transient current on VCCI is performed on devices within the IGLOO, IGLOO nano, IGLOO PLUS, ProASIC3, ProASIC3 nano, and ProASIC3L groups of devices, similarly to VCC transient current measurements. For ProASIC3 devices, the measurements at typical conditions show that the maximum transient current on VCCI, when the power supply is powered at ramp-rates ranging from 33 V/ms to 0.33 V/ms, does not exceed the maximum standby current specified in the device datasheet. Refer to the DC and Switching Characteristics chapters of the *ProASIC3 Flash Family FPGAS* datasheet and *ProASIC3E Flash Family FPGAs* datasheet for more information.

Similarly, IGLOO, IGLOO PLUS, and ProASIC3L devices exhibit very low transient current on VCCI. The transient current does not exceed the typical operating current of the device while in active mode. For example, the characterization of AGL600-FG256 V2 and V5 devices has shown that the transient current on VCCI is typically in the range of 1–2 mA.

## My Cases

Microsemi SoC Products Group customers may submit and track technical cases online by going to My Cases.

## Outside the U.S.

Customers needing assistance outside the US time zones can either contact technical support via email ([soc\\_tech@microsemi.com](mailto:soc_tech@microsemi.com)) or contact a local sales office. Sales office listings can be found at [www.microsemi.com/soc/company/contact/default.aspx](http://www.microsemi.com/soc/company/contact/default.aspx).

## ITAR Technical Support

For technical support on RH and RT FPGAs that are regulated by International Traffic in Arms Regulations (ITAR), contact us via [soc\\_tech\\_itar@microsemi.com](mailto:soc_tech_itar@microsemi.com). Alternatively, within My Cases, select **Yes** in the ITAR drop-down list. For a complete list of ITAR-regulated Microsemi FPGAs, visit the ITAR web page.
