Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	-
Number of Logic Elements/Cells	-
Total RAM Bits	36864
Number of I/O	68
Number of Gates	250000
Voltage - Supply	1.425V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	100-TQFP
Supplier Device Package	100-VQFP (14x14)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/a3pn250-vqg100i

Introduction

Contents

This user's guide contains information to help designers understand and use Microsemi's ProASIC[®]3 nano devices. Each chapter addresses a specific topic. Most of these chapters apply to other Microsemi device families as well. When a feature or description applies only to a specific device family, this is made clear in the text.

Revision History

The revision history for each chapter is listed at the end of the chapter. Most of these chapters were formerly included in device handbooks. Some were originally application notes or information included in device datasheets.

A "Summary of Changes" table at the end of this user's guide lists the chapters that were changed in each revision of the document, with links to the "List of Changes" sections for those chapters.

Related Information

Refer to the *ProASIC3 nano Low Power Flash FPGAs* datasheet for detailed specifications, timing, and package and pin information.

The website for ProASIC3 nano devices is [/www.microsemi.com/soc/products/pa3nano/default.aspx](http://www.microsemi.com/soc/products/pa3nano/default.aspx).

Chip and Quadrant Global I/Os

The following sections give an overview of naming conventions and other related I/O information.

Naming of Global I/Os

In low power flash devices, the global I/Os have access to certain clock conditioning circuitry and have direct access to the global network. Additionally, the global I/Os can be used as regular I/Os, since they have identical capabilities to those of regular I/Os. Due to the comprehensive and flexible nature of the I/Os in low power flash devices, a naming scheme is used to show the details of the I/O. The global I/O uses the generic name Gmn/IOuxwByVz. Note that Gmn refers to a global input pin and IOuxwByVz refers to a regular I/O Pin, as these I/Os can be used as either global or regular I/Os. Refer to the I/O Structures chapter of the user's guide for the device that you are using for more information on this naming convention.

Figure 3-4 represents the global input pins connection. It shows all 54 global pins available to access the 18 global networks in ProASIC3E families.

Figure 3-4 • Global Connections Details

standard for CLKBUF is LVTTTL in the current Microsemi Libero® System-on-Chip (SoC) and Designer software.

Table 3-9 • I/O Standards within CLKBUF

Name	Description
CLKBUF_LVCMOS5	LVCMOS clock buffer with 5.0 V CMOS voltage level
CLKBUF_LVCMOS33	LVCMOS clock buffer with 3.3 V CMOS voltage level
CLKBUF_LVCMOS25	LVCMOS clock buffer with 2.5 V CMOS voltage level ¹
CLKBUF_LVCMOS18	LVCMOS clock buffer with 1.8 V CMOS voltage level
CLKBUF_LVCMOS15	LVCMOS clock buffer with 1.5 V CMOS voltage level
CLKBUF_LVCMOS12	LVCMOS clock buffer with 1.2 V CMOS voltage level
CLKBUF_PCI	PCI clock buffer
CLKBUF_PCIX	PCIX clock buffer
CLKBUF_GTL25	GTL clock buffer with 2.5 V CMOS voltage level ¹
CLKBUF_GTL33	GTL clock buffer with 3.3 V CMOS voltage level ¹
CLKBUF_GTLP25	GTL+ clock buffer with 2.5 V CMOS voltage level ¹
CLKBUF_GTLP33	GTL+ clock buffer with 3.3 V CMOS voltage level ¹
CLKBUF_HSTL_I	HSTL Class I clock buffer ¹
CLKBUF_HSTL_II	HSTL Class II clock buffer ¹
CLKBUF_SSTL2_I	SSTL2 Class I clock buffer ¹
CLKBUF_SSTL2_II	SSTL2 Class II clock buffer ¹
CLKBUF_SSTL3_I	SSTL3 Class I clock buffer ¹
CLKBUF_SSTL3_II	SSTL3 Class II clock buffer ¹

Notes:

1. Supported in only the IGLOOe, ProASIC3E, AFS600, and AFS1500 devices
2. By default, the CLKBUF macro uses the 3.3 V LVTTTL I/O technology.

The current synthesis tool libraries only infer the CLKBUF or CLKINT macros in the netlist. All other global macros must be instantiated manually into your HDL code. The following is an example of CLKBUF_LVCMOS25 global macro instantiations that you can copy and paste into your code:

VHDL

```
component clkbuf_lvcmos25
  port (pad : in std_logic; y : out std_logic);
end component

begin
  -- concurrent statements
  u2 : clkbuf_lvcmos25 port map (pad => ext_clk, y => int_clk);
end
```

Verilog

```
module design (____);

  input ____;
  output ____;

  clkbuf_lvcmos25 u2 (.y(int_clk), .pad(ext_clk));

endmodule
```

You can control the maximum number of shared instances allowed for the legalization to take place using the Compile Option dialog box shown in Figure 3-17. Refer to Libero SoC / Designer online help for details on the Compile Option dialog box. A large number of shared instances most likely indicates a floorplanning problem that you should address.

Figure 3-17 • Shared Instances in the Compile Option Dialog Box

Designer Flow for Global Assignment

To achieve the desired result, pay special attention to global management during synthesis and place-and-route. The current Synplify tool does not insert more than six global buffers in the netlist by default. Thus, the default flow will not assign any signal to the quadrant global network. However, you can use attributes in Synplify and increase the default global macro assignment in the netlist. Designer v6.2 supports automatic quadrant global assignment, which was not available in Designer v6.1. Layout will make the choice to assign the correct signals to global. However, you can also utilize PDC and perform manual global assignment to overwrite any automatic assignment. The following step-by-step suggestions guide you in the layout of your design and help you improve timing in Designer:

1. Run Compile and check the Compile report. The Compile report has global information in the "Device Utilization" section that describes the number of chip and quadrant signals in the design. A "Net Report" section describes chip global nets, quadrant global nets, local clock nets, a list of nets listed by fanout, and net candidates for local clock assignment. Review this information. Note that YB or YC are counted as global only when they are used in isolation; if you use YB only and not GLB, this net is not shown in the global/quadrant nets report. Instead, it appears in the Global Utilization report.
2. If some signals have a very high fanout and are candidates for global promotion, promote those signals to global using the compile options or PDC commands. Figure 3-18 on page 54 shows the Globals Management section of the compile options. Select **Promote regular nets whose fanout is greater than** and enter a reasonable value for fanouts.

CCC Support in Microsemi's Flash Devices

The flash FPGAs listed in Table 4-1 support the CCC feature and the functions described in this document.

Table 4-1 • Flash-Based FPGAs

Series	Family*	Description
IGLOO	IGLOO	Ultra-low power 1.2 V to 1.5 V FPGAs with Flash*Freeze technology
	IGLOOe	Higher density IGLOO FPGAs with six PLLs and additional I/O standards
	IGLOO PLUS	IGLOO FPGAs with enhanced I/O capabilities
	IGLOO nano	The industry's lowest-power, smallest-size solution
ProASIC3	ProASIC3	Low power, high-performance 1.5 V FPGAs
	ProASIC3E	Higher density ProASIC3 FPGAs with six PLLs and additional I/O standards
	ProASIC3 nano	Lowest-cost solution with enhanced I/O capabilities
	ProASIC3L	ProASIC3 FPGAs supporting 1.2 V to 1.5 V with Flash*Freeze technology
	RT ProASIC3	Radiation-tolerant RT3PE600L and RT3PE3000L
	Military ProASIC3/EL	Military temperature A3PE600L, A3P1000, and A3PE3000L
	Automotive ProASIC3	ProASIC3 FPGAs qualified for automotive applications
Fusion	Fusion	Mixed signal FPGA integrating ProASIC3 FPGA fabric, programmable analog block, support for ARM® Cortex™-M1 soft processors, and flash memory into a monolithic device

Note: *The device names link to the appropriate datasheet, including product brief, DC and switching characteristics, and packaging information.

IGLOO Terminology

In documentation, the terms IGLOO series and IGLOO devices refer to all of the IGLOO devices as listed in Table 4-1. Where the information applies to only one product line or limited devices, these exclusions will be explicitly stated.

ProASIC3 Terminology

In documentation, the terms ProASIC3 series and ProASIC3 devices refer to all of the ProASIC3 devices as listed in Table 4-1. Where the information applies to only one product line or limited devices, these exclusions will be explicitly stated.

To further understand the differences between the IGLOO and ProASIC3 devices, refer to the *Industry's Lowest Power FPGAs Portfolio*.

Each global buffer, as well as the PLL reference clock, can be driven from one of the following:

- 3 dedicated single-ended I/Os using a hardwired connection
- 2 dedicated differential I/Os using a hardwired connection (not applicable for IGLOO nano and ProASIC3 nano devices)
- The FPGA core

Since the architecture of the devices varies as size increases, the following list details I/O types supported for globals:

IGLOO and ProASIC3

- LVDS-based clock sources are available only on 250 k gate devices and above (IGLOO nano and ProASIC3 nano devices do not support differential inputs).
- 60 k and 125 k gate devices support single-ended clock sources only.
- 15 k and 30 k gate devices support these inputs for CCC only and do not contain a PLL.
- nano devices:
 - 10 k, 15 k, and 20 k devices do not contain PLLs in the CCCs, and support only CLKBUF and CLKINT.
 - 60 k, 125 k, and 250 k devices support one PLL in the middle left CCC position. In the absence of the PLL, this CCC can be used by CLKBUF, CLKINT, and CLKDLY macros. The corner CCCs support CLKBUF, CLKINT, and CLKDLY.

Fusion

- AFS600 and AFS1500: All single-ended, differential, and voltage-referenced I/O standards (Pro I/O).
- AFS090 and AFS250: All single-ended and differential I/O standards.

Clock Sources for PLL and CLKDLY Macros

The input reference clock (CLKA for a PLL macro, CLK for a CLKDLY macro) can be accessed from different sources via the associated clock multiplexer tree. Each CCC has the option of choosing the source of the input clock from one of the following:

- Hardwired I/O
- External I/O
- Core Logic
- RC Oscillator (Fusion only)
- Crystal Oscillator (Fusion only)

The SmartGen macro builder tool allows users to easily create the PLL and CLKDLY macros with the desired settings. Microsemi strongly recommends using SmartGen to generate the CCC macros.

Hardwired I/O Clock Source

Hardwired I/O refers to global input pins that are hardwired to the multiplexer tree, which directly accesses the CCC global buffers. These global input pins have designated pin locations and are indicated with the I/O naming convention *Gmn* (*m* refers to any one of the positions where the PLL core is available, and *n* refers to any one of the three global input MUXes and the pin number of the associated global location, *m*). Choosing this option provides the benefit of directly connecting to the CCC reference clock input, which provides less delay. See Figure 4-9 on page 74 for an example illustration of the connections, shown in red. If a CLKDLY macro is initiated to utilize the programmable delay element of the CCC, the clock input can be placed at one of nine dedicated global input pin locations. In other words, if Hardwired I/O is chosen as the input source, the user can decide to place the input pin in one of the GmA0, GmA1, GmA2, GmB0, GmB1, GmB2, GmC0, GmC1, or GmC2 locations of the low power flash devices. When a PLL macro is used to utilize the PLL core in a CCC location, the clock input of the PLL can only be connected to one of three GmA* global pin locations: GmA0, GmA1, or GmA2.

Available I/O Standards

Table 4-4 • Available I/O Standards within CLKBUF and CLKBUF_LVDS/LVPECL Macros

CLKBUF_LVCMOS5
CLKBUF_LVCMOS33 ¹
CLKBUF_LVCMOS25 ²
CLKBUF_LVCMOS18
CLKBUF_LVCMOS15
CLKBUF_PCI
CLKBUF_PCIX ³
CLKBUF_GTL25 ^{2,3}
CLKBUF_GTL33 ^{2,3}
CLKBUF_GTLP25 ^{2,3}
CLKBUF_GTLP33 ^{2,3}
CLKBUF_HSTL_I ^{2,3}
CLKBUF_HSTL_II ^{2,3}
CLKBUF_SSTL3_I ^{2,3}
CLKBUF_SSTL3_II ^{2,3}
CLKBUF_SSTL2_I ^{2,3}
CLKBUF_SSTL2_II ^{2,3}
CLKBUF_LVDS ^{4,5}
CLKBUF_LVPECL ⁵

Notes:

1. By default, the CLKBUF macro uses 3.3 V LVTTTL I/O technology. For more details, refer to the IGLOO, ProASIC3, SmartFusion, and Fusion Macro Library Guide.
2. I/O standards only supported in ProASIC3E and IGLOOe families.
3. I/O standards only supported in the following Fusion devices: AFS600 and AFS1500.
4. B-LVDS and M-LVDS standards are supported by CLKBUF_LVDS.
5. Not supported for IGLOO nano and ProASIC3 nano devices.

Global Synthesis Constraints

The Synplify® synthesis tool, by default, allows six clocks in a design for Fusion, IGLOO, and ProASIC3. When more than six clocks are needed in the design, a user synthesis constraint attribute, `syn_global_buffers`, can be used to control the maximum number of clocks (up to 18) that can be inferred by the synthesis engine.

High-fanout nets will be inferred with clock buffers and/or internal clock buffers. If the design consists of CCC global buffers, they are included in the count of clocks in the design.

The subsections below discuss the clock input source (global buffers with no programmable delays) and the clock conditioning functional block (global buffers with programmable delays and/or PLL function) in detail.

Primary Clock Output Delay from CLKA -3.020

Secondary1 Clock frequency 40.000

Secondary1 Clock Phase Shift 0.000

Secondary1 Clock Global Output Delay from CLKA 2.515

Next, perform simulation in ModelSim to verify the correct delays. Figure 4-30 shows the simulation results. The delay values match those reported in the SmartGen PLL Wizard.

Figure 4-30 • ModelSim Simulation Results

The timing can also be analyzed using SmartTime in Designer. The user should import the synthesized netlist to Designer, perform Compile and Layout, and then invoke SmartTime. Go to **Tools > Options** and change the maximum delay operating conditions to **Typical Case**. Then expand the Clock-to-Out paths of GLA and GLB and the individual components of the path delays are shown. The path of GLA is shown in Figure 4-31 on page 107 displaying the same delay value.

FlashROM Support in Flash-Based Devices

The flash FPGAs listed in Table 5-1 support the FlashROM feature and the functions described in this document.

Table 5-1 • Flash-Based FPGAs

Series	Family*	Description
IGLOO	IGLOO	Ultra-low power 1.2 V to 1.5 V FPGAs with Flash*Freeze technology
	IGLOOe	Higher density IGLOO FPGAs with six PLLs and additional I/O standards
	IGLOO nano	The industry's lowest-power, smallest-size solution
	IGLOO PLUS	IGLOO FPGAs with enhanced I/O capabilities
ProASIC3	ProASIC3	Low power, high-performance 1.5 V FPGAs
	ProASIC3E	Higher density ProASIC3 FPGAs with six PLLs and additional I/O standards
	ProASIC3 nano	Lowest-cost solution with enhanced I/O capabilities
	ProASIC3L	ProASIC3 FPGAs supporting 1.2 V to 1.5 V with Flash*Freeze technology
	RT ProASIC3	Radiation-tolerant RT3PE600L and RT3PE3000L
	Military ProASIC3/EL	Military temperature A3PE600L, A3P1000, and A3PE3000L
	Automotive ProASIC3	ProASIC3 FPGAs qualified for automotive applications
Fusion	Fusion	Mixed signal FPGA integrating ProASIC3 FPGA fabric, programmable analog block, support for ARM® Cortex™-M1 soft processors, and flash memory into a monolithic device

Note: *The device names link to the appropriate datasheet, including product brief, DC and switching characteristics, and packaging information.

IGLOO Terminology

In documentation, the terms IGLOO series and IGLOO devices refer to all of the IGLOO devices as listed in Table 5-1. Where the information applies to only one product line or limited devices, these exclusions will be explicitly stated.

ProASIC3 Terminology

In documentation, the terms ProASIC3 series and ProASIC3 devices refer to all of the ProASIC3 devices as listed in Table 5-1. Where the information applies to only one product line or limited devices, these exclusions will be explicitly stated.

To further understand the differences between the IGLOO and ProASIC3 devices, refer to the *Industry's Lowest Power FPGAs Portfolio*.

Programming and Accessing FlashROM

The FlashROM content can only be programmed via JTAG, but it can be read back selectively through the JTAG programming interface, the UJTAG interface, or via direct FPGA core addressing. The pages of the FlashROM can be made secure to prevent read-back via JTAG. In that case, read-back on these secured pages is only possible by the FPGA core fabric or via UJTAG.

A 7-bit address from the FPGA core defines which of the eight pages (three MSBs) is being read, and which of the 16 bytes within the selected page (four LSBs) are being read. The FlashROM content can be read on a random basis; the access time is 10 ns for a device supporting commercial specifications. The FPGA core will be powered down during writing of the FlashROM content. FPGA power-down during FlashROM programming is managed on-chip, and FPGA core functionality is not available during programming of the FlashROM. Table 5-2 summarizes various FlashROM access scenarios.

Table 5-2 • FlashROM Read/Write Capabilities by Access Mode

Access Mode	FlashROM Read	FlashROM Write
JTAG	Yes	Yes
UJTAG	Yes	No
FPGA core	Yes	No

Figure 5-6 shows the accessing of the FlashROM using the UJTAG macro. This is similar to FPGA core access, where the 7-bit address defines which of the eight pages (three MSBs) is being read and which of the 16 bytes within the selected page (four LSBs) are being read. Refer to the "UJTAG Applications in Microsemi's Low Power Flash Devices" section on page 297 for details on using the UJTAG macro to read the FlashROM.

Figure 5-7 on page 123 and Figure 5-8 on page 123 show the FlashROM access from the JTAG port. The FlashROM content can be read on a random basis. The three-bit address defines which page is being read or updated.

Figure 5-6 • Block Diagram of Using UJTAG to Read FlashROM Contents

Example of RAM Initialization

This section of the document presents a sample design in which a 4×4 RAM block is being initialized through the JTAG port. A test feature has been implemented in the design to read back the contents of the RAM after initialization to verify the procedure.

The interface block of this example performs two major functions: initialization of the RAM block and running a test procedure to read back the contents. The clock output of the interface is either the write clock (for initialization) or the read clock (for reading back the contents). The Verilog code for the interface block is included in the "Sample Verilog Code" section on page 151.

For simulation purposes, users can declare the input ports of the UJTAG macro for easier assignment in the testbench. However, the UJTAG input ports should not be declared on the top level during synthesis. If the input ports of the UJTAG are declared during synthesis, the synthesis tool will instantiate input buffers on these ports. The input buffers on the ports will cause Compile to fail in Designer.

Figure 6-10 shows the simulation results for the initialization step of the example design.

The CLK_OUT signal, which is the clock output of the interface block, is the inverted DR_UPDATE output of the UJTAG macro. It is clear that it gives sufficient time (while the TAP Controller is in the Data Register Update state) for the write address and data to become stable before loading them into the RAM block.

Figure 6-11 presents the test procedure of the example. The data read back from the memory block matches the written data, thus verifying the design functionality.

Figure 6-10 • Simulation of Initialization Step

Figure 6-11 • Simulation of the Test Procedure of the Example

```
//
addr_counter counter_1 (.Clock(data_update), .Q(wr_addr), .Aset(rst_n),

begin
    if (!Aset) Qaux <= 2'b11;
    else if (Enable) Qaux <= Qaux + 1;
end

assign Q = Qaux;

endmodule
```

I/O Software Support

In Microsemi's Libero software, default settings have been defined for the various I/O standards supported. Changes can be made to the default settings via the use of attributes; however, not all I/O attributes are applicable for all I/O standards.

Table 7-15 • nano I/O Attributes vs. I/O Standard Applications

I/O Standard	SLEW (output only)	OUT_DRIVE (output only)	RES_PULL	OUT_LOAD (output only)		Schmitt Trigger	Hold State	Combine Register
				IGLOO nano	ProASIC 3 nano			
LVTTTL/ LVCMOS3.3	✓	✓ (8)	✓	✓	✓	✓	✓	✓
LVCMOS2.5	✓	✓ (8)	✓	✓	✓	✓	✓	✓
LVCMOS1.8	✓	✓ (4)	✓	✓	✓	✓	✓	✓
LVCMOS1.5	✓	✓ (2)	✓	✓	✓	✓	✓	✓
LVCMOS1.2	✓	✓ (2)	✓	✓	–	✓	✓	✓
Software Defaults	HIGH	Refer to numbers in parentheses in above cells.	None	All Devices: 5 pF	10 pF or 35 pF*	Off	Off	No

Note: *10 pF for A3PN010, A3PN015, and A3PN020; 35 pF for A3PN060, A3PN125, and A3PN250.

Flash FPGAs I/O Support

The flash FPGAs listed in Table 8-1 support I/Os and the functions described in this document.

Table 8-1 • Flash-Based FPGAs

Series	Family*	Description
IGLOO	IGLOO	Ultra-low power 1.2 V to 1.5 V FPGAs with Flash*Freeze technology
	IGLOOe	Higher density IGLOO FPGAs with six PLLs and additional I/O standards
	IGLOO nano	The industry's lowest-power, smallest-size solution
	IGLOO PLUS	IGLOO FPGAs with enhanced I/O capabilities
ProASIC3	ProASIC3	Low power, high-performance 1.5 V FPGAs
	ProASIC3E	Higher density ProASIC3 FPGAs with six PLLs and additional I/O standards
	ProASIC3 nano	Lowest-cost solution with enhanced I/O capabilities
	ProASIC3L	ProASIC3 FPGAs supporting 1.2 V to 1.5 V with Flash*Freeze technology
	RT ProASIC3	Radiation-tolerant RT3PE600L and RT3PE3000L
	Military ProASIC3/EL	Military temperature A3PE600L, A3P1000, and A3PE3000L
	Automotive ProASIC3	ProASIC3 FPGAs qualified for automotive applications
Fusion	Fusion	Mixed signal FPGA integrating ProASIC3 FPGA fabric, programmable analog block, support for ARM® Cortex™-M1 soft processors, and flash memory into a monolithic device

Note: *The device names link to the appropriate datasheet, including product brief, DC and switching characteristics, and packaging information.

IGLOO Terminology

In documentation, the terms IGLOO series and IGLOO devices refer to all of the IGLOO devices as listed in Table 8-1. Where the information applies to only one product line or limited devices, these exclusions will be explicitly stated.

ProASIC3 Terminology

In documentation, the terms ProASIC3 series and ProASIC3 devices refer to all of the ProASIC3 devices as listed in Table 8-1. Where the information applies to only one product line or limited devices, these exclusions will be explicitly stated.

To further understand the differences between the IGLOO and ProASIC3 devices, refer to the *Industry's Lowest Power FPGAs Portfolio*.

Output Buffers

There are two variations: Regular and Special.

If the **Regular** variation is selected, only the Width (1 to 128) needs to be entered. The default value for Width is 1.

The **Special** variation has Width, Technology, Output Drive, and Slew Rate options.

Bidirectional Buffers

There are two variations: Regular and Special.

The **Regular** variation has Enable Polarity (Active High, Active Low) in addition to the Width option.

The **Special** variation has Width, Technology, Output Drive, Slew Rate, and Resistor Pull-Up/-Down options.

Tristate Buffers

Same as Bidirectional Buffers.

DDR

There are eight variations: DDR with Regular Input Buffers, Special Input Buffers, Regular Output Buffers, Special Output Buffers, Regular Tristate Buffers, Special Tristate Buffers, Regular Bidirectional Buffers, and Special Bidirectional Buffers.

These variations resemble the options of the previous I/O macro. For example, the Special Input Buffers variation has Width, Technology, Voltage Level, and Resistor Pull-Up/-Down options. DDR is not available on IGLOO PLUS devices.

4. Once the desired configuration is selected, click the **Generate** button. The Generate Core window opens (Figure 8-4).
 5. Enter a name for the macro. Click **OK**. The core will be generated and saved to the appropriate location within the project files (Figure 8-5 on page 191).
-

Figure 8-4 • Generate Core Window

6. Instantiate the I/O macro in the top-level code.

The user must instantiate the DDR_REG or DDR_OUT macro in the design. Use SmartGen to generate both these macros and then instantiate them in your top level. To combine the DDR macros with the I/O, the following rules must be met:

Compiling the Design

During Compile, a PDC I/O constraint file can be imported along with the netlist file. If only the netlist file is compiled, certain I/O assignments need to be completed before proceeding to Layout. All constraints that can be entered in PDC can also be entered using ChipPlanner, I/O Attribute Editor, and PinEditor.

There are certain rules that must be followed in implementing I/O register combining and the I/O DDR macro (refer to the I/O Registers section of the handbook for the device that you are using and the "DDR" section on page 190 for details). Provided these rules are met, the user can enable or disable I/O register combining by using the PDC command `set_io portname -register yes|no` in the I/O Attribute Editor or selecting a check box in the Compile Options dialog box (see Figure 8-7). The Compile Options dialog box appears when the design is compiled for the first time. It can also be accessed by choosing **Options > Compile** during successive runs. I/O register combining is off by default. The PDC command overrides the setting in the Compile Options dialog box.

Figure 8-7 • Setting Register Combining During Compile

Understanding the Compile Report

The I/O bank report is generated during Compile and displayed in the log window. This report lists the I/O assignments necessary before Layout can proceed.

When Designer is started, the I/O Bank Assigner tool is run automatically if the Layout command is executed. The I/O Bank Assigner takes care of the necessary I/O assignments. However, these assignments can also be made manually with MVN or by importing the PDC file. Refer to the "Assigning Technologies and VREF to I/O Banks" section on page 198 for further description.

The I/O bank report can also be extracted from Designer by choosing **Tools > Report** and setting the Report Type to **IOBank**.

This report has the following tables: I/O Function, I/O Technology, I/O Bank Resource Usage, and I/O Voltage Usage. This report is useful if the user wants to do I/O assignments manually.

Programming Support in Flash Devices

The flash FPGAs listed in Table 10-1 support flash in-system programming and the functions described in this document.

Table 10-1 • Flash-Based FPGAs

Series	Family*	Description
IGLOO	IGLOO	Ultra-low power 1.2 V to 1.5 V FPGAs with Flash*Freeze technology
	IGLOOe	Higher density IGLOO FPGAs with six PLLs and additional I/O standards
	IGLOO nano	The industry's lowest-power, smallest-size solution, supporting 1.2 V to 1.5 V core voltage with Flash*Freeze technology
	IGLOO PLUS	IGLOO FPGAs with enhanced I/O capabilities
ProASIC3	ProASIC3	Low power, high-performance 1.5 V FPGAs
	ProASIC3E	Higher density ProASIC3 FPGAs with six PLLs and additional I/O standards
	ProASIC3 nano	Lowest-cost solution with enhanced I/O capabilities
	ProASIC3L	ProASIC3 FPGAs supporting 1.2 V to 1.5 V core voltage with Flash*Freeze technology
	RT ProASIC3	Radiation-tolerant RT3PE600L and RT3PE3000L
	Military ProASIC3/EL	Military temperature A3PE600L, A3P1000, and A3PE3000L
	Automotive ProASIC3	ProASIC3 FPGAs qualified for automotive applications
SmartFusion	SmartFusion	Mixed-signal FPGA integrating FPGA fabric, programmable microcontroller subsystem (MSS), including programmable analog and ARM® Cortex™-M3 hard processor and flash memory in a monolithic device
Fusion	Fusion	Mixed signal FPGA integrating ProASIC3 FPGA fabric, programmable analog block, support for ARM® Cortex™-M1 soft processors, and flash memory into a monolithic device
ProASIC	ProASIC	First generation ProASIC devices
	ProASIC ^{PLUS}	Second generation ProASIC devices

Note: *The device names link to the appropriate datasheet, including product brief, DC and switching characteristics, and packaging information.

IGLOO Terminology

In documentation, the terms IGLOO series and IGLOO devices refer to all of the IGLOO devices as listed in Table 10-1. Where the information applies to only one product line or limited devices, these exclusions will be explicitly stated.

ProASIC3 Terminology

In documentation, the terms ProASIC3 series and ProASIC3 devices refer to all of the ProASIC3 devices as listed in Table 10-1. Where the information applies to only one product line or limited devices, these exclusions will be explicitly stated.

To further understand the differences between the IGLOO and ProASIC3 devices, refer to the *Industry's Lowest Power FPGAs Portfolio*.

Signal Integrity While Using ISP

For ISP of flash devices, customers are expected to follow the board-level guidelines provided on the Microsemi SoC Products Group website. These guidelines are discussed in the datasheets and application notes (refer to the “Related Documents” section of the datasheet for application note links). Customers are also expected to troubleshoot board-level signal integrity issues by measuring voltages and taking oscilloscope plots.

Programming Failure Allowances

Microsemi has strict policies regarding programming failure allowances. Please refer to *Programming and Functional Failure Guidelines* on the Microsemi SoC Products Group website for details.

Contacting the Customer Support Group

Highly skilled engineers staff the Customer Applications Center from 7:00 A.M. to 6:00 P.M., Pacific time, Monday through Friday. You can contact the center by one of the following methods:

Electronic Mail

You can communicate your technical questions to our email address and receive answers back by email, fax, or phone. Also, if you have design problems, you can email your design files to receive assistance. Microsemi monitors the email account throughout the day. When sending your request to us, please be sure to include your full name, company name, and contact information for efficient processing of your request. The technical support email address is soc_tech@microsemi.com.

Telephone

Our Technical Support Hotline answers all calls. The center retrieves information, such as your name, company name, telephone number, and question. Once this is done, a case number is assigned. Then the center forwards the information to a queue where the first available applications engineer receives the data and returns your call. The phone hours are from 7:00 A.M. to 6:00 P.M., Pacific time, Monday through Friday.

The Customer Applications Center number is (800) 262-1060.

European customers can call +44 (0) 1256 305 600.

Typical UJTAG Applications

Bidirectional access to the JTAG port from VersaTiles—without putting the device into test mode—creates flexibility to implement many different applications. This section describes a few of these. All are based on importing/exporting data through the UJTAG tiles.

Clock Conditioning Circuitry—Dynamic Reconfiguration

In low power flash devices, CCCs, which include PLLs, can be configured dynamically through either an 81-bit embedded shift register or static flash programming switches. These 81 bits control all the characteristics of the CCC: routing MUX architectures, delay values, divider values, etc. Table 16-3 lists the 81 configuration bits in the CCC.

Table 16-3 • Configuration Bits of Fusion, IGLOO, and ProASIC3 CCC Blocks

Bit Number(s)	Control Function
80	RESET ENABLE
79	DYNCSSEL
78	DYNBSEL
77	DYNASEL
<76:74>	VCOSSEL [2:0]
73	STATCSSEL
72	STATBSEL
71	STATASEL
<70:66>	DLYC [4:0]
<65:61>	DLYB [4:0]
<60:56>	DLYGLC [4:0]
<55:51>	DLYGLB [4:0]
<50:46>	DLYGLA [4:0]
45	XDLYSEL
<44:40>	FBDLY [4:0]
<39:38>	FBSEL
<37:35>	OCMUX [2:0]
<34:32>	OBMUX [2:0]
<31:29>	OAMUX [2:0]
<28:24>	OCDIV [4:0]
<23:19>	OBDIV [4:0]
<18:14>	OADIV [4:0]
<13:7>	FBDIV [6:0]
<6:0>	FINDIV [6:0]

The embedded 81-bit shift register (for the dynamic configuration of the CCC) is accessible to the VersaTiles, which, in turn, have access to the UJTAG tiles. Therefore, the CCC configuration shift register can receive and load the new configuration data stream from JTAG.

Dynamic reconfiguration eliminates the need to reprogram the device when reconfiguration of the CCC functional blocks is needed. The CCC configuration can be modified while the device continues to operate. Employing the UJTAG core requires the user to design a module to provide the configuration data and control the CCC configuration shift register. In essence, this is a user-designed TAP Controller requiring chip resources.

Similar reconfiguration capability exists in the ProASIC^{PLUS}® family. The only difference is the number of shift register bits controlling the CCC (27 in ProASIC^{PLUS} and 81 in IGLOO, ProASIC3, and Fusion).

My Cases

Microsemi SoC Products Group customers may submit and track technical cases online by going to My Cases.

Outside the U.S.

Customers needing assistance outside the US time zones can either contact technical support via email (soc_tech@microsemi.com) or contact a local sales office. Sales office listings can be found at www.microsemi.com/soc/company/contact/default.aspx.

ITAR Technical Support

For technical support on RH and RT FPGAs that are regulated by International Traffic in Arms Regulations (ITAR), contact us via soc_tech_itar@microsemi.com. Alternatively, within My Cases, select **Yes** in the ITAR drop-down list. For a complete list of ITAR-regulated Microsemi FPGAs, visit the ITAR web page.
