

Welcome to [E-XFL.COM](#)

### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### Applications of "[Embedded - Microcontrollers](#)"

#### Details

|                            |                                                                                                                                                                     |
|----------------------------|---------------------------------------------------------------------------------------------------------------------------------------------------------------------|
| Product Status             | Active                                                                                                                                                              |

## 3.2 Power

The EFM32JG12 has an Energy Management Unit (EMU) and efficient integrated regulators to generate internal supply voltages. Only a single external supply voltage is required, from which all internal voltages are created. An optional integrated DC-DC buck regulator can be utilized to further reduce the current consumption. The DC-DC regulator requires one external inductor and one external capacitor.

The EFM32JG12 device family includes support for internal supply voltage scaling, as well as two different power domains groups for peripherals. These enhancements allow for further supply current reductions and lower overall power consumption.

AVDD and VREGVDD need to be 1.8 V or higher for the MCU to operate across all conditions; however the rest of the system will operate down to 1.62 V, including the digital supply and I/O. This means that the device is fully compatible with 1.8 V components. Running from a sufficiently high supply, the device can use the DC-DC to regulate voltage not only for itself, but also for other PCB components, supplying up to a total of 200 mA.

### 3.2.1 Energy Management Unit (EMU)

The Energy Management Unit manages transitions of energy modes in the device. Each energy mode defines which peripherals and features are available and the amount of current the device consumes. The EMU can also be used to turn off the power to unused RAM blocks, and it contains control registers for the DC-DC regulator and the Voltage Monitor (VMON). The VMON is used to monitor multiple supply voltages. It has multiple channels which can be programmed individually by the user to determine if a sensed supply has fallen below a chosen threshold.

### 3.2.2 DC-DC Converter

The DC-DC buck converter covers a wide range of load currents and provides up to 90% efficiency in energy modes EM0, EM1, EM2 and EM3, and can supply up to 200 mA to the device and surrounding PCB components. Protection features include programmable current limiting, short-circuit protection, and dead-time protection. The DC-DC converter may also enter bypass mode when the input voltage is too low for efficient operation. In bypass mode, the DC-DC input supply is internally connected directly to its output through a low resistance switch. Bypass mode also supports in-rush current limiting to prevent input supply voltage droops due to excessive output current transients.

### 3.2.3 Power Domains

The EFM32JG12 has two peripheral power domains for operation in EM2 and lower. If all of the peripherals in a peripheral power domain are configured as unused, the power domain for that group will be powered off in the low-power mode, reducing the overall current consumption of the device.

**Table 3.1. Peripheral Power Subdomains**

| Peripheral Power Domain 1 | Peripheral Power Domain 2 |
|---------------------------|---------------------------|
| ACMP0                     | ACMP1                     |
| PCNT0                     | PCNT1                     |
| ADC0                      | PCNT2                     |
| LETIMER0                  | CSEN                      |
| LESENSE                   | DAC0                      |
| APORT                     | LEUART0                   |
| -                         | I2C0                      |
| -                         | I2C1                      |
| -                         | IDAC                      |

### 3.12 Configuration Summary

The features of the EFM32JG12 are a subset of the feature set described in the device reference manual. The table below describes device specific implementation of the features. Remaining modules support full configuration.

**Table 3.2. Configuration Summary**

| Module  | Configuration                   | Pin Connections                 |
|---------|---------------------------------|---------------------------------|
| USART0  | IrDA SmartCard                  | US0_TX, US0_RX, US0_CLK, US0_CS |
| USART1  | IrDA I <sup>2</sup> S SmartCard | US1_TX, US1_RX, US1_CLK, US1_CS |
| USART2  | IrDA SmartCard                  | US2_TX, US2_RX, US2_CLK, US2_CS |
| USART3  | IrDA I <sup>2</sup> S SmartCard | US3_TX, US3_RX, US3_CLK, US3_CS |
| TIMER0  | with DTI                        | TIM0_CC[2:0], TIM0_CDTI[2:0]    |
| TIMER1  | -                               | TIM1_CC[3:0]                    |
| WTIMER0 | with DTI                        | WTIM0_CC[2:0], WTIM0_CDTI[2:0]  |
| WTIMER1 | -                               | WTIM1_CC[3:0]                   |

## 4. Electrical Specifications

### 4.1 Electrical Characteristics

All electrical parameters in all tables are specified under the following conditions, unless stated otherwise:

- Typical values are based on  $T_{AMB}=25^{\circ}\text{C}$  and  $V_{DD}=3.3\text{ V}$ , by production test and/or technology characterization.
- Minimum and maximum values represent the worst conditions across supply voltage, process variation, and operating temperature, unless stated otherwise.

Refer to [4.1.2.1 General Operating Conditions](#) for more details about operational supply and temperature limits.

#### 4.1.1 Absolute Maximum Ratings

Stresses above those listed below may cause permanent damage to the device. This is a stress rating only and functional operation of the devices at those or any other conditions above those indicated in the operation listings of this specification is not implied. Exposure to maximum rating conditions for extended periods may affect device reliability. For more information on the available quality and reliability data, see the Quality and Reliability Monitor Report at <http://www.silabs.com/support/quality/pages/default.aspx>.

**Table 4.1. Absolute Maximum Ratings**

| Parameter                           | Symbol          | Test Condition                     | Min  | Typ | Max                      | Unit               |
|-------------------------------------|-----------------|------------------------------------|------|-----|--------------------------|--------------------|
| Storage temperature range           | $T_{STG}$       |                                    | -50  | —   | 150                      | $^{\circ}\text{C}$ |
| Voltage on any supply pin           | $V_{DDMAX}$     |                                    | -0.3 | —   | 3.8                      | V                  |
| Voltage ramp rate on any supply pin | $V_{DDRAMPMAX}$ |                                    | —    | —   | 1                        | V / $\mu\text{s}$  |
| DC voltage on any GPIO pin          | $V_{DIGPIN}$    | 5V tolerant GPIO pins <sup>1</sup> | -0.3 | —   | Min of 5.25 and IOVDD +2 | V                  |
|                                     |                 | Non-5V tolerant GPIO pins          | -0.3 | —   | IOVDD+0.3                | V                  |
| Voltage on HFXO pins                | $V_{HFXOPIN}$   |                                    | -0.3 | —   | 1.4                      | V                  |
| Total current into VDD power lines  | $I_{VDDMAX}$    | Source                             | —    | —   | 200                      | mA                 |
| Total current into VSS ground lines | $I_{VSSMAX}$    | Sink                               | —    | —   | 200                      | mA                 |
|                                     |                 | Sink                               | —    | —   | 200                      | mA                 |
| Current per I/O pin                 | $I_{IOMAX}$     | Sink                               | —    | —   | 50                       | mA                 |
|                                     |                 | Source                             | —    | —   | 50                       | mA                 |
| Current for all I/O pins            | $I_{IOALLMAX}$  | Sink                               | —    | —   | 200                      | mA                 |
|                                     |                 | Source                             | —    | —   | 200                      | mA                 |
| Junction temperature                | $T_J$           | -G grade devices                   | -40  | —   | 105                      | $^{\circ}\text{C}$ |
|                                     |                 | -I grade devices                   | -40  | —   | 125                      | $^{\circ}\text{C}$ |

**Note:**

1. When a GPIO pin is routed to the analog module through the APORT, the maximum voltage = IOVDD.

## 4.1.5 Current Consumption

### 4.1.5.1 Current Consumption 3.3 V without DC-DC Converter

Unless otherwise indicated, typical conditions are: VREGVDD = AVDD = DVDD = 3.3 V. T<sub>OP</sub> = 25 °C. DCDC is off. Minimum and maximum values in this table represent the worst conditions across supply voltage and process variation at T<sub>OP</sub> = 25 °C.

**Table 4.5. Current Consumption 3.3 V without DC-DC Converter**

| Parameter                                                                                 | Symbol                 | Test Condition                                                        | Min | Typ  | Max | Unit   |
|-------------------------------------------------------------------------------------------|------------------------|-----------------------------------------------------------------------|-----|------|-----|--------|
| Current consumption in EM0 mode with all peripherals disabled                             | I <sub>ACTIVE</sub>    | 38.4 MHz crystal, CPU running while loop from flash <sup>1</sup>      | —   | 126  | —   | μA/MHz |
|                                                                                           |                        | 38 MHz HFRCO, CPU running Prime from flash                            | —   | 99   | —   | μA/MHz |

**Note:**

1. Mass erase is issued by the CPU and erases all flash.
2. Device erase is issued over the AAP interface and erases all flash, SRAM, the Lock Bit (LB) page, and the User data page Lock Word (ULW).
3. Flash data retention information is published in the Quarterly Quality and Reliability Report.
4. Measured at 25 °C.

## 4.1.21 USART SPI

### SPI Master Timing

Table 4.30. SPI Master Timing

| Parameter                      | Symbol         | Test Condition | Min                  | Typ | Max  | Unit |
|--------------------------------|----------------|----------------|----------------------|-----|------|------|
| SCLK period <sup>1 3 2</sup>   | $t_{SCLK}$     |                | 2 *<br>$t_{HPERCLK}$ | —   | —    | ns   |
| CS to MOSI <sup>1 3</sup>      | $t_{CS\_MO}$   |                | 0                    | —   | 13.3 | ns   |
| SCLK to MOSI <sup>1 3</sup>    | $t_{SCLK\_MO}$ |                | 0                    | —   | 8    | ns   |
| MISO setup time <sup>1 3</sup> | $t_{SU\_MI}$   | IOVDD = 1.62 V | 90                   | —   | —    | ns   |
|                                |                | IOVDD = 3.0 V  | 40                   | —   | —    | ns   |
| MISO hold time <sup>1 3</sup>  | $t_{H\_MI}$    |                | 10                   | —   | —    | ns   |

**Note:**

1. Applies for both CLKPHA = 0 and CLKPHA = 1 (figure only shows CLKPHA = 0).
2.  $t_{HPERCLK}$  is one period of the selected HPERCLK.
3. Measurement done with 8 pF output loading at 10% and 90% of  $V_{DD}$  (figure shows 50% of  $V_{DD}$ ).

Figure 4.1. SPI Master Timing Diagram

Figure 4.7. EM2, EM3, EM4H and EM4S Typical Supply Current vs. Supply

## 4.2.2 DC-DC Converter

Default test conditions: CCM mode, LDCDC = 4.7  $\mu$ H, CDCDC = 4.7  $\mu$ F, VDCDC\_I = 3.3 V, VDCDC\_O = 1.8 V, FDCDC\_LN = 7 MHz

Figure 4.8. DC-DC Converter Typical Performance Characteristics

## 5. Typical Connection Diagrams

### 5.1 Power

Typical power supply connections for direct supply, without using the internal DC-DC converter, are shown in [Figure 5.1 EFM32JG12 Typical Application Circuit, Direct Supply, No DC-DC Converter on page 59](#).

**Figure 5.1. EFM32JG12 Typical Application Circuit, Direct Supply, No DC-DC Converter**

A typical application circuit using the internal DC-DC converter is shown in [Figure 5.2 EFM32JG12 Typical Application Circuit Using the DC-DC Converter on page 59](#). The MCU operates from the DC-DC converter supply.

**Figure 5.2. EFM32JG12 Typical Application Circuit Using the DC-DC Converter**

### 5.2 Other Connections

Other components or connections may be required to meet the system-level requirements. Application Note AN0002: "Hardware Design Considerations" contains detailed information on these connections. Application Notes can be accessed on the Silicon Labs website ([www.silabs.com/32bit-appnotes](http://www.silabs.com/32bit-appnotes)).

## 9. Revision History

### 9.1 Revision 0.5

2017-02-10

- Updated Feature List and Front Page with latest characterization numbers.
- List of OPNs in Ordering Table consolidated.
- Electrical Characteristics Table Changes
  - All specification tables updated with latest characterization data and production test limits.
  - Split HFRCO/AUXHFRCO table into separate tables for HFRCO and AUXHFRCO.
  - OPAMP, CSEN, and VDAC specification line items updated to match test conditions.
  - Added tables for Analog Port (APORT) and Pulse Counter (PCNT).
- Added Typical Performance Curves for supply current and DCDC parameters.
- Added APORT Connection Diagram.

### 9.2 Revision 0.2

December 9th, 2016

Initial release.

|           |                                                   |           |
|-----------|---------------------------------------------------|-----------|
| 3.10.2    | Memory System Controller (MSC)                    | 9         |
| 3.10.3    | Linked Direct Memory Access Controller (LDMA)     | 9         |
