Understanding [Embedded - Microcontroller, Microprocessor, FPGA Modules](#)

Embedded - Microcontroller, Microprocessor, and FPGA Modules are fundamental components in modern electronic systems, offering a wide range of functionalities and capabilities. Microcontrollers are compact integrated circuits designed to execute specific control tasks within an embedded system. They typically include a processor, memory, and input/output peripherals on a single chip. Microprocessors, on the other hand, are more powerful processing units used in complex computing tasks, often requiring external memory and peripherals. FPGAs (Field Programmable Gate Arrays) are highly flexible devices that can be configured by the user to perform specific logic functions, making them invaluable in applications requiring customization and adaptability.

Micromodule with Xilinx Kintex UltraScale KU035, 2 GByte DDR4, Speedgrade 2

Order number: TE0841-02-035-2I

Product information "Micromodule with Xilinx Kintex UltraScale KU035, 2 GByte DDR4, Speedgrade 2"

The Trenz Electronic TE0841-02-035-2I is a powerful FPGA module integrating a Xilinx Kintex UltraScale KU035, 2 GByte DDR4, 64 MByte (512 MBit) SPI Boot Flash for configuration and operation, and powerful switch-mode power supplies for all on-board voltages. A large number of configurable I/O's is provided via rugged high-speed stacking strips.

All this on a tiny footprint, smaller than a credit card, at the most competitive price. Modules in 4 x 5 cm form factor are fully mechanically and largely electrically compatible among each other.

All parts are at least industrial temperature range of -40°C to +85°C. The module operating temperature range depends on customer design and cooling solution. Please contact us for options.
