

Welcome to [E-XFL.COM](https://www.e-xfl.com)

What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "[Embedded - Microcontrollers](#)"

Details

Product Status	Active
Core Processor	PIC
Core Size	8-Bit
Speed	25MHz
Connectivity	I ² C, SPI, UART/USART
Peripherals	Brown-out Detect/Reset, LVD, POR, PWM, WDT
Number of I/O	36
Program Memory Size	4KB (2K x 16)
Program Memory Type	FLASH
EEPROM Size	256 x 8
RAM Size	512 x 8
Voltage - Supply (Vcc/Vdd)	4.2V ~ 5.5V
Data Converters	A/D 13x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Through Hole
Package / Case	40-DIP (0.600", 15.24mm)
Supplier Device Package	40-PDIP
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic18f4220-e-p

5.8 Look-up Tables

Look-up tables are implemented two ways:

- Computed GOTO
- Table Reads

5.8.1 COMPUTED GOTO

A computed GOTO is accomplished by adding an offset to the program counter. An example is shown in Example 5-4.

A look-up table can be formed with an ADDWF PCL instruction and a group of RETLW 0xnn instructions. WREG is loaded with an offset into the table before executing a call to that table. The first instruction of the called routine is the ADDWF PCL instruction. The next instruction executed will be one of the RETLW 0xnn instructions that returns the value 0xnn to the calling function.

The offset value (in WREG) specifies the number of bytes that the program counter should advance and should be multiples of 2 (LSB = 0).

In this method, only one data byte may be stored in each instruction location and room on the return address stack is required.

EXAMPLE 5-4: COMPUTED GOTO USING AN OFFSET VALUE

	MOVFW	OFFSET
	CALL	TABLE
ORG	0xnn00	
TABLE	ADDWF	PCL
	RETLW	0xnn
	RETLW	0xnn
	RETLW	0xnn
	•	
	•	
	•	

5.8.2 TABLE READS/TABLE WRITES

A better method of storing data in program memory allows two bytes of data to be stored in each instruction location.

Look-up table data may be stored two bytes per program word by using table reads and writes. The Table Pointer (TBLPTR) specifies the byte address and the Table Latch (TABLAT) contains the data that is read from, or written to program memory. Data is transferred to/from program memory, one byte at a time.

The Table Read/Table Write operation is discussed further in **Section 6.1 “Table Reads and Table Writes”**.

5.9 Data Memory Organization

The data memory is implemented as static RAM. Each register in the data memory has a 12-bit address, allowing up to 4096 bytes of data memory. Figure 5-6 shows the data memory organization for the PIC18F2X20/4X20 devices.

The data memory map is divided into as many as 16 banks that contain 256 bytes each. The lower 4 bits of the Bank Select Register (BSR<3:0>) select which bank will be accessed. The upper 4 bits of the BSR are not implemented.

The data memory contains Special Function Registers (SFR) and General Purpose Registers (GPR). The SFRs are used for control and status of the controller and peripheral functions, while GPRs are used for data storage and scratch pad operations in the user's application. The SFRs start at the last location of Bank 15 (FFFh) and extend towards F80h. Any remaining space beyond the SFRs in the bank may be implemented as GPRs. GPRs start at the first location of Bank 0 and grow upwards. Any read of an unimplemented location will read as '0's.

The entire data memory may be accessed directly or indirectly. Direct addressing may require the use of the BSR register. Indirect addressing requires the use of a File Select Register (FSRn) and a corresponding Indirect File Operand (INDFn). Each FSR holds a 12-bit address value that can be used to access any location in the data memory map without banking. See **Section 5.12 “Indirect Addressing, INDF and FSR Registers”** for indirect addressing details.

The instruction set and architecture allow operations across all banks. This may be accomplished by indirect addressing or by the use of the MOVFF instruction. The MOVFF instruction is a two-word/two-cycle instruction that moves a value from one register to another.

To ensure that commonly used registers (SFRs and select GPRs) can be accessed in a single cycle, regardless of the current BSR values, an Access Bank is implemented. A segment of Bank 0 and a segment of Bank 15 comprise the Access RAM. **Section 5.10 “Access Bank”** provides a detailed description of the Access RAM.

5.9.1 GENERAL PURPOSE REGISTER FILE

Enhanced MCU devices may have banked memory in the GPR area. GPRs are not initialized by a Power-on Reset and are unchanged on all other Resets.

Data RAM is available for use as GPR registers by all instructions. The second half of Bank 15 (F80h to FFFh) contains SFRs. All other banks of data memory contain GPRs, starting with Bank 0.

PIC18F2220/2320/4220/4320

Example 8-3 shows the sequence to do a 16 x 16 unsigned multiply. Equation 8-1 shows the algorithm that is used. The 32-bit result is stored in four registers, RES3:RES0.

EQUATION 8-1: 16 x 16 UNSIGNED MULTIPLICATION ALGORITHM

$$\begin{aligned} \text{RES3:RES0} &= \text{ARG1H:ARG1L} \cdot \text{ARG2H:ARG2L} \\ &= (\text{ARG1H} \cdot \text{ARG2H} \cdot 2^{16}) + \\ &\quad (\text{ARG1H} \cdot \text{ARG2L} \cdot 2^8) + \\ &\quad (\text{ARG1L} \cdot \text{ARG2H} \cdot 2^8) + \\ &\quad (\text{ARG1L} \cdot \text{ARG2L}) \end{aligned}$$

EXAMPLE 8-3: 16 x 16 UNSIGNED MULTIPLY ROUTINE

```

MOVF    ARG1L, W
MULWF   ARG2L      ; ARG1L * ARG2L ->
                    ; PRODH:PRODL

MOVFF   PRODH, RES1 ;
MOVFF   PRODL, RES0 ;

;
MOVF    ARG1H, W
MULWF   ARG2H      ; ARG1H * ARG2H ->
                    ; PRODH:PRODL

MOVFF   PRODH, RES3 ;
MOVFF   PRODL, RES2 ;

;
MOVF    ARG1L, W
MULWF   ARG2H      ; ARG1L * ARG2H ->
                    ; PRODH:PRODL

MOVF    PRODL, W
ADDWF   RES1, F    ; Add cross
MOVF    PRODH, W   ; products
ADDWFC  RES2, F    ;
CLRF    WREG       ;
ADDWFC  RES3, F    ;

;
MOVF    ARG1H, W
MULWF   ARG2L      ; ARG1H * ARG2L ->
                    ; PRODH:PRODL

MOVF    PRODL, W
ADDWF   RES1, F    ; Add cross
MOVF    PRODH, W   ; products
ADDWFC  RES2, F    ;
CLRF    WREG       ;
ADDWFC  RES3, F    ;

```

Example 8-4 shows the sequence to do a 16 x 16 signed multiply. Equation 8-2 shows the algorithm used. The 32-bit result is stored in four registers, RES3:RES0. To account for the sign bits of the arguments, each argument pairs' Most Significant bit (MSb) is tested and the appropriate subtractions are done.

EQUATION 8-2: 16 x 16 SIGNED MULTIPLICATION ALGORITHM

$$\begin{aligned} \text{RES3:RES0} &= \text{ARG1H:ARG1L} \cdot \text{ARG2H:ARG2L} \\ &= (\text{ARG1H} \cdot \text{ARG2H} \cdot 2^{16}) + \\ &\quad (\text{ARG1H} \cdot \text{ARG2L} \cdot 2^8) + \\ &\quad (\text{ARG1L} \cdot \text{ARG2H} \cdot 2^8) + \\ &\quad (\text{ARG1L} \cdot \text{ARG2L}) + \\ &\quad (-1 \cdot \text{ARG2H} < 7 > \cdot \text{ARG1H:ARG1L} \cdot 2^{16}) + \\ &\quad (-1 \cdot \text{ARG1H} < 7 > \cdot \text{ARG2H:ARG2L} \cdot 2^{16}) \end{aligned}$$

EXAMPLE 8-4: 16 x 16 SIGNED MULTIPLY ROUTINE

x = Bit is unknown

bit 7	INT2IP: INT2 External Interrupt Priority bit 1 = High priority 0 = Low priority
bit 6	INT1IP: INT1 External Interrupt Priority bit 1 = High priority 0 = Low priority
bit 5	Unimplemented: Read as '0'
bit 4	INT2IE: INT2 External Interrupt Enable bit 1 = Enables the INT2 external interrupt 0 = Disables the INT2 external interrupt
bit 3	INT1IE: INT1 External Interrupt Enable bit 1 = Enables the INT1 external interrupt 0 = Disables the INT1 external interrupt
bit 2	Unimplemented: Read as '0'
bit 1	INT2IF: INT2 External Interrupt Flag bit 1 = The INT2 external interrupt occurred (must be cleared in software) 0 = The INT2 external interrupt did not occur
bit 0	INT1IF: INT1 External Interrupt Flag bit 1 = The INT1 external interrupt occurred (must be cleared in software) 0 = The INT1 external interrupt did not occur

Note: Interrupt flag bits are set when an interrupt condition occurs regardless of the state of its corresponding enable bit or the global enable bit. User software should ensure the appropriate interrupt flag bits are clear prior to enabling an interrupt. This feature allows for software polling.

10.0 I/O PORTS

Depending on the device selected and features enabled, there are up to five ports available. Some pins of the I/O ports are multiplexed with an alternate function from the peripheral features on the device. In general, when a peripheral is enabled, that pin may not be used as a general purpose I/O pin.

Each port has three registers for its operation. These registers are:

- TRIS register (Data Direction register)
- PORT register (reads the levels on the pins of the device)
- LAT register (Data Latch)

The Data Latch (LAT register) is useful for read-modify-write operations on the value that the I/O pins are driving.

A simplified model of a generic I/O port without the interfaces to other peripherals is shown in Figure 10-1.

FIGURE 10-1: GENERIC I/O PORT OPERATION

10.1 PORTA, TRISA and LATA Registers

PORTA is an 8-bit wide, bidirectional port. The corresponding Data Direction register is TRISA. Setting a TRISA bit (= 1) will make the corresponding PORTA pin an input (i.e., put the corresponding output driver in a high-impedance mode). Clearing a TRISA bit (= 0) will make the corresponding PORTA pin an output (i.e., put the contents of the output latch on the selected pin).

Reading the PORTA register reads the status of the pins, whereas writing to it, will write to the port latch.

The Data Latch register (LATA) is also memory mapped. Read-modify-write operations on the LATA register read and write the latched output value for PORTA.

The RA4 pin is multiplexed with the Timer0 module clock input and one of the comparator outputs to become the RA4/T0CKI/C1OUT pin. Pins RA6 and RA7 are multiplexed with the main oscillator pins; they are enabled as oscillator or I/O pins by the selection of the main oscillator in Configuration Register 1H (see **Section 23.1 "Configuration Bits"** for details). When they are not used as port pins, RA6 and RA7 and their associated TRIS and LAT bits are read as '0'.

The other PORTA pins are multiplexed with analog inputs, the analog VREF+ and VREF- inputs and the comparator voltage reference output. The operation of pins, RA3:RA0 and RA5, as A/D converter inputs is selected by clearing/setting the control bits in the ADCON1 register (A/D Control Register 1). Pins RA0 through RA5 may also be used as comparator inputs or outputs by setting the appropriate bits in the CMCON register.

Note: On a Power-on Reset, RA5 and RA3:RA0 are configured as analog inputs and read as '0'. RA4 is configured as a digital input.

The RA4/T0CKI/C1OUT pin is a Schmitt Trigger input and an open-drain output. All other PORTA pins have TTL input levels and full CMOS output drivers.

The TRISA register controls the direction of the RA pins even when they are being used as analog inputs. The user must ensure the bits in the TRISA register are maintained set when using them as analog inputs.

EXAMPLE 10-1: INITIALIZING PORTA

```
CLRF    PORTA    ; Initialize PORTA by
                  ; clearing output
                  ; data latches
CLRF    LATA      ; Alternate method
                  ; to clear output
                  ; data latches

TABLE 10-9: PORTE FUNCTIONS

Name	Bit#	Buffer Type	Function
RE0/AN5/ \overline{RD}	bit 0	ST/TTL ⁽¹⁾	Input/output port pin, analog input or read control input in Parallel Slave Port mode. For \overline{RD} (PSP Control mode): 1 = PSP is Idle 0 = Read operation. Reads PORTD register (if chip selected).
RE1/AN6/ \overline{WR}	bit 1	ST/TTL ⁽¹⁾	Input/output port pin, analog input or write control input in Parallel Slave Port mode. For \overline{WR} (PSP Control mode): 1 = PSP is Idle 0 = Write operation. Writes PORTD register (if chip selected).
RE2/AN7/ \overline{CS}	bit 2	ST/TTL ⁽¹⁾	Input/output port pin, analog input or chip select control input in Parallel Slave Port mode. For \overline{CS} (PSP Control mode): 1 = PSP is Idle 0 = External device is selected
$\overline{MCLR}/VPP/RE3^{(2)}$	bit 3	ST	Input only port pin or programming voltage input (if \overline{MCLR} is disabled); Master Clear input or programming voltage input (if \overline{MCLR} is enabled).

Legend: ST = Schmitt Trigger input, TTL = TTL input

Note 1: Input buffers are Schmitt Triggers when in I/O mode and TTL buffers when in Parallel Slave Port mode.

2: The RE3 port bit is available as an input-only pin only in 40-pin devices and when Master Clear functionality is disabled (CONFIG3H<7>=0).

TABLE 10-10: SUMMARY OF REGISTERS ASSOCIATED WITH PORTE

Name	Bit 7	Bit 6	Bit 5	Bit 4	Bit 3	Bit 2	Bit 1	Bit 0	Value on POR, BOR	Value on all other Resets
PORTE	—	—	—	—	RE3 ⁽¹⁾	RE2	RE1	RE0	---- qxxx	---- quuu
LATE	—	—	—	—	—	LATE Data Latch Register			---- -xxx	---- -uuu
TRISE	IBF	OBF	IBOV	PSPMODE	—	PORTE Data Direction bits			0000 -111	0000 -111
ADCON1	—	—	VCFG1	VCFG0	PCFG3	PCFG2	PCFG1	PCFG0	--00 0000	--00 0000

Legend: x = unknown, u = unchanged, - = unimplemented, read as '0', q = value depends on condition.
Shaded cells are not used by PORTE.

Note 1: The RE3 port bit is available as an input-only pin only in 40-pin devices and when Master Clear functionality is disabled (CONFIG3H<7>=0).

PIC18F2220/2320/4220/4320

15.5 PWM Mode

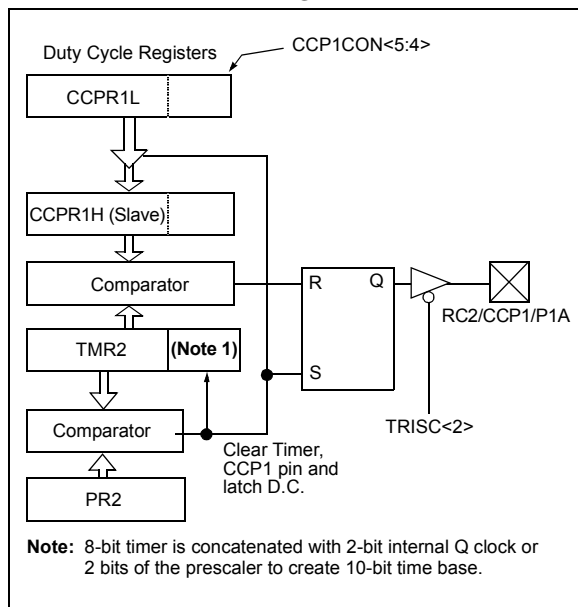

In Pulse Width Modulation (PWM) mode, the CCP1 pin produces up to a 10-bit resolution PWM output. Since the CCP1 pin is multiplexed with the PORTC data latch, the TRISC<2> bit must be cleared to make the CCP1 pin an output.

Note: Clearing the CCP1CON register will force the CCP1 PWM output latch to the default low level. This is not the PORTC I/O data latch.

Figure 15-3 shows a simplified block diagram of the CCP module in PWM mode.

For a step-by-step procedure on how to set up the CCP module for PWM operation, see **Section 15.5.3 “Setup for PWM Operation”**.

FIGURE 15-3: SIMPLIFIED PWM BLOCK DIAGRAM

A PWM output (Figure 15-4) has a time base (*period*) and a time that the output is high (*duty cycle*). The frequency of the PWM is the inverse of the period (1/period).

FIGURE 15-4: PWM OUTPUT

15.5.1 PWM PERIOD

The PWM period is specified by writing to the PR2 register. The PWM period can be calculated using the following equation.

EQUATION 15-1:

$$\text{PWM Period} = [(PR2) + 1] \cdot 4 \cdot T_{osc} \cdot (\text{TMR2 Prescale Value})$$

PWM frequency is defined as 1/[PWM period]. When TMR2 is equal to PR2, the following three events occur on the next increment cycle:

- TMR2 is cleared
- The CCP1 pin is set (if PWM duty cycle = 0%, the CCP1 pin will not be set)
- The PWM duty cycle is copied from CCPR1L into CCPR1H

Note: The Timer2 postscaler (see **Section 13.0 “Timer2 Module”**) is not used in the determination of the PWM frequency. The postscaler could be used to have a servo update rate at a different frequency than the PWM output.

15.5.2 PWM DUTY CYCLE

The PWM duty cycle is specified by writing to the CCPR1L register and to the CCP1CON<5:4> bits. Up to 10-bit resolution is available. The CCPR1L contains the eight MSBs and the CCP1CON<5:4> contains the two LSbs. This 10-bit value is represented by CCPR1L:CCP1CON<5:4>. The PWM duty cycle is calculated by the following equation.

EQUATION 15-2:

$$\text{PWM Duty Cycle} = (\text{CCPR1L:CCP1CON<5:4>}) \cdot T_{osc} \cdot (\text{TMR2 Prescale Value})$$

CCPR1L and CCP1CON<5:4> can be written to at any time but the duty cycle value is not copied into CCPR1H until a match between PR2 and TMR2 occurs (i.e., the period is complete). In PWM mode, CCPR1H is a read-only register.

00 = Drive Pins B and D to '0'
01 = Drive Pins B and D to '1'
1x = Pins B and D tri-state

17.4.8 I²C MASTER MODE START CONDITION TIMING

To initiate a Start condition, the user sets the Start Condition Enable bit, SEN (SSPCON2<0>). If the SDA and SCL pins are sampled high, the Baud Rate Generator is reloaded with the contents of SSPADD<6:0> and starts its count. If SCL and SDA are both sampled high when the Baud Rate Generator times out (TBRG), the SDA pin is driven low. The action of the SDA being driven low while SCL is high is the Start condition and causes the S bit (SSPSTAT<3>) to be set. Following this, the Baud Rate Generator is reloaded with the contents of SSPADD<6:0> and resumes its count. When the Baud Rate Generator times out (TBRG), the SEN bit (SSPCON2<0>) will be automatically cleared by hardware, the Baud Rate Generator is suspended, leaving the SDA line held low and the Start condition is complete.

Note: If, at the beginning of the Start condition, the SDA and SCL pins are already sampled low or if during the Start condition, the SCL line is sampled low before the SDA line is driven low, a bus collision occurs, the Bus Collision Interrupt Flag, BCLIF, is set, the Start condition is aborted and the I²C module is reset into its Idle state.

17.4.8.1 WCOL Status Flag

If the user writes the SSPBUF when a Start sequence is in progress, the WCOL is set and the contents of the buffer are unchanged (the write doesn't occur).

Note: Because queueing of events is not allowed, writing to the lower 5 bits of SSPCON2 is disabled until the Start condition is complete.

FIGURE 17-19: FIRST START BIT TIMING

PIC18F2220/2320/4220/4320

FIGURE 21-1: COMPARATOR VOLTAGE REFERENCE BLOCK DIAGRAM

21.2 Voltage Reference Accuracy/Error

The full range of voltage reference cannot be realized due to the construction of the module. The transistors on the top and bottom of the resistor ladder network (Figure 21-1) keep CVREF from approaching the reference source rails. The voltage reference is derived from VDD; therefore, the CVREF output changes with fluctuations in VDD. The tested absolute accuracy of the voltage reference can be found in **Section 26.0 “Electrical Characteristics”**.

21.3 Operation in Power-Managed Modes

The contents of the CVRCON register are not affected by entry to or exit from power-managed modes. To minimize current consumption in power-managed modes, the voltage reference module should be disabled; however, this can cause an interrupt from the comparators so the comparator interrupt should also be disabled while the CVRCON register is being modified.

21.4 Effects of a Reset

A device Reset disables the voltage reference by clearing the CVRCON register. This also disconnects the reference from the RA2 pin, selects the high-voltage range and selects the lowest voltage tap from the resistor divider.

21.5 Connection Considerations

The voltage reference module operates independently of the comparator module. The output of the reference generator may be output using the RA2 pin if the CVROE bit is set. Enabling the voltage reference output onto the RA2 pin, with an input signal present, will increase current consumption.

The RA2 pin can be used as a simple D/A output with limited drive capability. Due to the limited current drive capability, an external buffer must be used on the voltage reference output for external connections to VREF. Figure 21-2 shows an example buffering technique.

BTG	f, d, a	Bit Toggle f	1	0111	bbba	ffff	ffff	None	1, 2

Note 1: When a PORT register is modified as a function of itself (e.g., `MOVF PORTB, 1, 0`), the value used will be that value present on the pins themselves. For example, if the data latch is '1' for a pin configured as input and is driven low by an external device, the data will be written back with a '0'.

- If this instruction is executed on the TMR0 register (and where applicable, d = 1), the prescaler will be cleared if assigned.
- If Program Counter (PC) is modified or a conditional test is true, the instruction requires two cycles. The second cycle is executed as a `NOP`.
- Some instructions are 2-word instructions. The second word of these instructions will be executed as a `NOP` unless the first word of the instruction retrieves the information embedded in these 16 bits. This ensures that all program memory locations have a valid instruction.
- If the table write starts the write cycle to internal memory, the write will continue until terminated.

PIC18F2220/2320/4220/4320

BCF Bit Clear f

Syntax: `[/label] BCF f,b[,a]`

Operands: $0 \leq f \leq 255$
 $0 \leq b \leq 7$
 $a \in [0,1]$

Operation: $0 \rightarrow f[b]$

Status Affected: None

Encoding:

1001	bbba	ffff	ffff
------	------	------	------

Description: Bit 'b' in register 'f' is cleared. If 'a' is '0', the Access Bank will be selected, overriding the BSR value. If 'a' = 1, then the bank will be selected as per the BSR value (default).

Words: 1

Cycles: 1

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register 'f'	Process Data	Write register 'f'

Example: `BCF FLAG_REG, 7`

Before Instruction
FLAG_REG = 0xC7

After Instruction
FLAG_REG = 0x47

BN Branch if Negative

Syntax: `[/label] BN n`

Operands: $-128 \leq n \leq 127$

Operation: if Negative bit is '1',
 $(PC) + 2 + 2n \rightarrow PC$

Status Affected: None

Encoding:

1110	0110	nnnn	nnnn
------	------	------	------

Description: If the Negative bit is '1', then the program will branch. The 2's complement number '2n' is added to the PC. Since the PC will have incremented to fetch the next instruction, the new address will be $PC + 2 + 2n$. This instruction is then a two-cycle instruction.

Words: 1

Cycles: 1(2)

Q Cycle Activity:

If Jump:

Q1	Q2	Q3	Q4
Decode	Read literal 'n'	Process Data	Write to PC
No operation	No operation	No operation	No operation

If No Jump:

Q1	Q2	Q3	Q4
Decode	Read literal 'n'	Process Data	No operation

Example: `HERE BN Jump`

Before Instruction
PC = address (HERE)

After Instruction
If Negative = 1;
PC = address (Jump)
If Negative = 0;
PC = address (HERE + 2)

PIC18F2220/2320/4220/4320

INCFSZ	Increment f, Skip if 0				
Syntax:	[<i>label</i>] INCFSZ f [,d [,a]]				
Operands:	$0 \leq f \leq 255$ $d \in [0,1]$ $a \in [0,1]$				
Operation:	$(f) + 1 \rightarrow \text{dest},$ skip if result = 0				
Status Affected:	None				
Encoding:	<table><tr><td>0011</td><td>11da</td><td>ffff</td><td>ffff</td></tr></table>	0011	11da	ffff	ffff
0011	11da	ffff	ffff		
Description:	<p>The contents of register 'f' are incremented. If 'd' is '0', the result is placed in W. If 'd' is '1', the result is placed back in register 'f' (default).</p> <p>If the result is '0', the next instruction which is already fetched is discarded and a NOP is executed instead, making it a two-cycle instruction. If 'a' is '0', the Access Bank will be selected, overriding the BSR value. If 'a' = 1, then the bank will be selected as per the BSR value (default).</p>				
Words:	1				
Cycles:	1(2) Note: 3 cycles if skip and followed by a 2-word instruction.				

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register 'f'	Process Data	Write to destination

If skip:

Q1	Q2	Q3	Q4
No operation	No operation	No operation	No operation

If skip and followed by 2-word instruction:

Q1	Q2	Q3	Q4
No operation	No operation	No operation	No operation
No operation	No operation	No operation	No operation

Example:

HERE	INCFSZ	CNT
NZERO	:	
ZERO	:	

Before Instruction

PC = Address (HERE)

After Instruction

CNT = CNT + 1
 If CNT = 0;
 PC = Address (ZERO)
 If CNT ≠ 0;
 PC = Address (NZERO)

INFSNZ	Increment f, Skip if Not 0				
Syntax:	[<i>label</i>] INFSNZ f [,d [,a]]				
Operands:	$0 \leq f \leq 255$ $d \in [0,1]$ $a \in [0,1]$				
Operation:	$(f) + 1 \rightarrow \text{dest}$, skip if result $\neq 0$				
Status Affected:	None				
Encoding:	<table><tr><td>0100</td><td>10da</td><td>ffff</td><td>ffff</td></tr></table>	0100	10da	ffff	ffff
0100	10da	ffff	ffff		
Description:	<p>The contents of register 'f' are incremented. If 'd' is '0', the result is placed in W. If 'd' is '1', the result is placed back in register 'f' (default).</p> <p>If the result is not '0', the next instruction which is already fetched is discarded and a NOP is executed instead, making it a two-cycle instruction. If 'a' is '0', the Access Bank will be selected, overriding the BSR value. If 'a' = 1, then the bank will be selected as per the BSR value (default).</p>				
Words:	1				
Cycles:	1(2)				
	Note: 3 cycles if skip and followed by a 2-word instruction.				

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register 'f'	Process Data	Write to destination

If skip:

Q1	Q2	Q3	Q4
No operation	No operation	No operation	No operation

If skip and followed by 2-word instruction:

Q1	Q2	Q3	Q4
No operation	No operation	No operation	No operation
No operation	No operation	No operation	No operation

Example:

HERE	INFSNZ	REG
ZERO	:	
NZERO	:	

Before Instruction

PC = Address (HERE)

After Instruction

REG = REG + 1
 If REG ≠ 0;
 PC = Address (NZERO)
 If REG = 0;
 PC = Address (ZERO)

XORWF Exclusive OR W with f

Syntax: `[label] XORWF f [,d [,a]]`

Operands: $0 \leq f \leq 255$
 $d \in [0,1]$
 $a \in [0,1]$

Operation: $(W) .XOR. (f) \rightarrow dest$

Status Affected: N, Z

Encoding:

0001	10da	ffff	ffff
------	------	------	------

Description: Exclusive OR the contents of W with register 'f'. If 'd' is '0', the result is stored in W. If 'd' is '1', the result is stored back in the register 'f' (default). If 'a' is '0', the Access Bank will be selected, overriding the BSR value. If 'a' is '1', then the bank will be selected as per the BSR value (default).

Words: 1

Cycles: 1

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register 'f'	Process Data	Write to destination

Example: XORWF REG

Before Instruction

REG = 0xAF
W = 0xB5

After Instruction

REG = 0x1A
W = 0xB5

PIC18F2220/2320/4220/4320

	All devices	340	550	μA	-40°C	VDD = 5.0V	
		330	550	μA	+25°C		
		310	550	μA	+85°C		
	Extended devices	410	650	μA	+125°C		
	PIC18LF2X20/4X20	350	600	μA	-40°C	VDD = 2.0V	FOSC = 4 MHz (RC_RUN mode, internal oscillator source)
		360	600	μA	+25°C		
		370	600	μA	+85°C		
	PIC18LF2X20/4X20	580	900	μA	-40°C	VDD = 3.0V	
		580	900	μA	+25°C		
		560	900	μA	+85°C		
	All devices	1.1	1.8	mA	-40°C	VDD = 5.0V	
		1.1	1.8	mA	+25°C		
		1.0	1.8	mA	+85°C		
Extended devices	1.2	1.8	mA	+125°C			

Legend: Shading of rows is to assist in readability of the table.

- Note 1:** The power-down current in Sleep mode does not depend on the oscillator type. Power-down current is measured with the part in Sleep mode, with all I/O pins in high-impedance state and tied to V_{DD} or V_{SS} and all features that add delta current disabled (such as WDT, Timer1 Oscillator, BOR, etc.).
- 2:** The supply current is mainly a function of operating voltage, frequency and mode. Other factors, such as I/O pin loading and switching rate, oscillator type and circuit, internal code execution pattern and temperature, also have an impact on the current consumption.
The test conditions for all I_{DD} measurements in active operation mode are:
OSC1 = external square wave, from rail-to-rail; all I/O pins tri-stated, pulled to V_{DD} ;
MCLR = V_{DD} ; WDT enabled/disabled as specified.
- 3:** For RC oscillator configurations, current through REXT is not included. The current through the resistor can be estimated by the formula $I_r = V_{DD}/2R_{EXT}$ (mA) with R_{EXT} in $k\Omega$.
- 4:** Standard low-cost 32 kHz crystals have an operating temperature range of -10°C to $+70^{\circ}\text{C}$. Extended temperature crystals are available at a much higher cost.

PIC18F2220/2320/4220/4320

26.4.3 TIMING DIAGRAMS AND SPECIFICATIONS

FIGURE 26-6: EXTERNAL CLOCK TIMING (ALL MODES EXCEPT PLL)

TABLE 26-6: EXTERNAL CLOCK TIMING REQUIREMENTS

Param. No.	Symbol	Characteristic	Min	Max	Units	Conditions
1A	Fosc	External CLKI Frequency ⁽¹⁾	DC	40	MHz	EC, ECIO (industrial)
			DC	25	MHz	EC, ECIO (extended)
		Oscillator Frequency ⁽¹⁾	DC	4	MHz	RC osc
			0.1	1	MHz	XT osc
			4	25	MHz	HS osc
			4	10	MHz	HS + PLL osc (industrial)
			4	6.25	MHz	HS + PLL osc (extended)
			5	33	kHz	LP Osc mode
1	Tosc	External CLKI Period ⁽¹⁾	25	—	ns	EC, ECIO (industrial)
			40	—	ns	EC, ECIO (extended)
		Oscillator Period ⁽¹⁾	250	—	ns	RC osc
			1	—	μs	XT osc
			40	250	ns	HS osc
			100	250	ns	HS + PLL osc (industrial)
			160	250	ns	HS + PLL osc (extended)
			30	—	μs	LP osc
2	Tcy	Instruction Cycle Time ⁽¹⁾	100	—	ns	Tcy = 4/Fosc (industrial)
			160	—	ns	Tcy = 4/Fosc (extended)
3	TosL, TosH	External Clock in (OSC1) High or Low Time	30	—	ns	XT osc
			2.5	—	μs	LP osc
			10	—	ns	HS osc
4	TosR, TosF	External Clock in (OSC1) Rise or Fall Time	—	20	ns	XT osc
			—	50	ns	LP osc
			—	7.5	ns	HS osc

Note 1: Instruction cycle period (Tcy) equals four times the input oscillator time base period for all configurations except PLL. All specified values are based on characterization data for that particular oscillator type under standard operating conditions with the device executing code. Exceeding these specified limits may result in an unstable oscillator operation and/or higher than expected current consumption. All devices are tested to operate at “min.” values with an external clock applied to the OSC1/CLKI pin. When an external clock input is used, the “max.” cycle time limit is “DC” (no clock) for all devices.

PIC18F2220/2320/4220/4320

FIGURE 26-23: A/D CONVERSION TIMING

TABLE 26-25: A/D CONVERSION REQUIREMENTS

Param No.	Symbol	Characteristic		Min	Max	Units	Conditions
130	TAD	A/D Clock Period	PIC18FXX20	1.6	20 ⁽²⁾	μs	TOSC based, VREF ≥ 3.0V
			PIC18LFXX20	3.0	20 ⁽²⁾	μs	TOSC based, VREF full range
			PIC18FXX20	2.0	6.0	μs	A/D RC mode
			PIC18LFXX20	3.0	9.0	μs	A/D RC mode
131	TCNV	Conversion Time (not including acquisition time) ⁽¹⁾		11	12	TAD	

Note 1: ADRES register may be read on the following T_{cy} cycle.

Note 2: The time of the A/D clock period is dependent on the device frequency and the TAD clock divider.

Fail-Safe Clock Monitor (FSCM)	250	USART Synchronous Reception (Master Mode, SREN)	208
First Start Bit	183	USART Synchronous Transmission (Master/Slave)	344
Full-Bridge PWM Output	146		
Half-Bridge PWM Output	145		
I ² C Bus Data	340		
I ² C Bus Start/Stop Bits	339		
I ² C Master Mode (Transmission, 7 or 10-Bit Address)	186		
I ² C Slave Mode (Transmission, 10-Bit Address)	173		
I ² C Slave Mode (Transmission, 7-Bit Address)	171		
I ² C Slave Mode with SEN = 0 (Reception, 10-Bit Address)	172		
I ² C Slave Mode with SEN = 0 (Reception, 7-Bit Address)	170
