
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	PIC
Core Size	8-Bit
Speed	33MHz
Connectivity	UART/USART
Peripherals	POR, PWM, WDT
Number of I/O	33
Program Memory Size	4KB (2K x 16)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	232 x 8
Voltage - Supply (Vcc/Vdd)	4.5V ~ 6V
Data Converters	-
Oscillator Type	External
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	44-QFP
Supplier Device Package	44-MQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic17c42a-33e-pq

Legend: u = unchanged, x = unknown, - = unimplemented read as '0', q = value depends on condition.

Note 1: One or more bits in INTSTA, PIR will be affected (to cause wake-up).

2: When the wake-up is due to an interrupt and the GLINTD bit is cleared, the PC is loaded with the interrupt vector.

3: See Table 4-3 for reset value of specific condition.

4: Only applies to the PIC17C42.

5: Does not apply to the PIC17C42.

5.4 Interrupt Operation

Global Interrupt Disable bit, GLINTD (CPUSTA<4>), enables all unmasked interrupts (if clear) or disables all interrupts (if set). Individual interrupts can be disabled through their corresponding enable bits in the INTSTA register. Peripheral interrupts need either the global peripheral enable PEIE bit disabled, or the specific peripheral enable bit disabled. Disabling the peripherals via the global peripheral enable bit, disables all peripheral interrupts. GLINTD is set on reset (interrupts disabled).

The `RETFIE` instruction allows returning from interrupt and re-enable interrupts at the same time.

When an interrupt is responded to, the GLINTD bit is automatically set to disable any further interrupt, the return address is pushed onto the stack and the PC is loaded with interrupt vector. There are four interrupt vectors to reduce interrupt latency.

The peripheral interrupt vector has multiple interrupt sources. Once in the peripheral interrupt service routine, the source(s) of the interrupt can be determined by polling the interrupt flag bits. The peripheral interrupt flag bit(s) must be cleared in software before re-enabling interrupts to avoid continuous interrupts.

The PIC17C4X devices have four interrupt vectors. These vectors and their hardware priority are shown in Table 5-1. If two enabled interrupts occur “at the same time”, the interrupt of the highest priority will be serviced first. This means that the vector address of that interrupt will be loaded into the program counter (PC).

TABLE 5-1: INTERRUPT VECTORS/ PRIORITIES

Address	Vector	Priority
0008h	External Interrupt on RA0/ INT pin (INTF)	1 (Highest)
0010h	TMR0 overflow interrupt (T0IF)	2
0018h	External Interrupt on T0CKI (T0CKIF)	3
0020h	Peripherals (PEIF)	4 (Lowest)

Note 1: Individual interrupt flag bits are set regardless of the status of their corresponding mask bit or the GLINTD bit.

Note 2: When disabling any of the INTSTA enable bits, the GLINTD bit should be set (disabled).

Note 3: For the PIC17C42 only:
If an interrupt occurs while the Global Interrupt Disable (GLINTD) bit is being set, the GLINTD bit may unintentionally be re-enabled by the user’s Interrupt Service Routine (the `RETFIE` instruction). The events that would cause this to occur are:

1. An interrupt occurs simultaneously with an instruction that sets the GLINTD bit.
2. The program branches to the Interrupt vector and executes the Interrupt Service Routine.
3. The Interrupt Service Routine completes with the execution of the `RETFIE` instruction. This causes the GLINTD bit to be cleared (enables interrupts), and the program returns to the instruction after the one which was meant to disable interrupts.

The method to ensure that interrupts are globally disabled is:

1. Ensure that the GLINTD bit was set by the instruction, as shown in the following code:

```
LOOP   BSF    CPUSTA, GLINTD ; Disable Global
                             ; Interrupt
       BTFSS  CPUSTA, GLINTD ; Global Interrupt
                             ; Disabled?
       GOTO   LOOP           ; NO, try again
                             ; YES, continue
                             ; with program
                             ; low
```

5.5 RA0/INT Interrupt

The external interrupt on the RA0/INT pin is edge triggered. Either the rising edge, if INTEDG bit (T0STA<7>) is set, or the falling edge, if INTEDG bit is clear. When a valid edge appears on the RA0/INT pin, the INTF bit (INTSTA<4>) is set. This interrupt can be disabled by clearing the INTE control bit (INTSTA<0>). The INT interrupt can wake the processor from SLEEP. See Section 14.4 for details on SLEEP operation.

5.6 TMR0 Interrupt

An overflow (FFFFh $\rightarrow$ 0000h) in TMR0 will set the T0IF (INTSTA<5>) bit. The interrupt can be enabled/disabled by setting/clearing the T0IE control bit (INTSTA<1>). For operation of the Timer0 module, see Section 11.0.

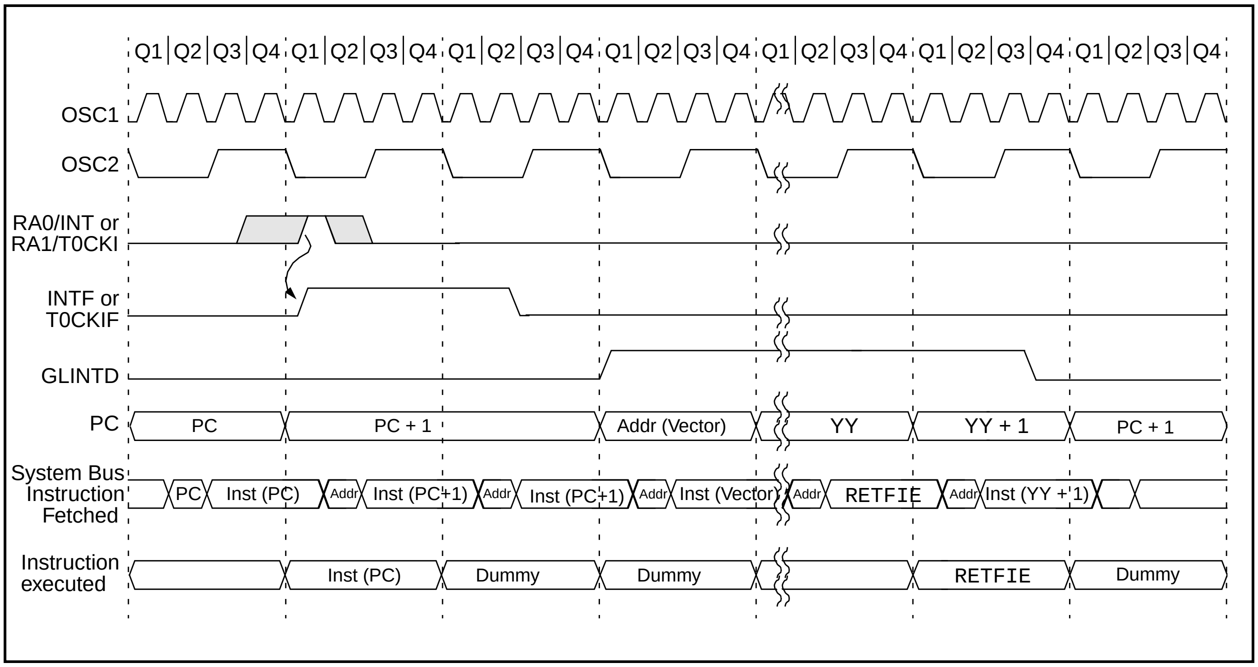
5.7 T0CKI Interrupt

The external interrupt on the RA1/T0CKI pin is edge triggered. Either the rising edge, if the T0SE bit (T0STA<6>) is set, or the falling edge, if the T0SE bit is clear. When a valid edge appears on the RA1/T0CKI pin, the T0CKIF bit (INTSTA<6>) is set. This interrupt can be disabled by clearing the T0CKIE control bit (INTSTA<2>). The T0CKI interrupt can wake up the processor from SLEEP. See Section 14.4 for details on SLEEP operation.

5.8 Peripheral Interrupt

The peripheral interrupt flag indicates that at least one of the peripheral interrupts occurred (PEIF is set). The PEIF bit is a read only bit, and is a bit wise OR of all the flag bits in the PIR register AND'ed with the corresponding enable bits in the PIE register. Some of the peripheral interrupts can wake the processor from SLEEP. See Section 14.4 for details on SLEEP operation.

FIGURE 5-5: INT PIN / T0CKI PIN INTERRUPT TIMING



6.2.2.3 TMR0 STATUS/CONTROL REGISTER (T0STA)

This register contains various control bits. Bit7 (INTEDG) is used to control the edge upon which a signal on the RA0/INT pin will set the RB0/INT interrupt flag. The other bits configure the Timer0 prescaler and clock source. (Figure 11-1).

FIGURE 6-9: T0STA REGISTER (ADDRESS: 05h, UNBANKED)

R/W - 0	R/W - 0	R/W - 0	R/W - 0	R/W - 0	R/W - 0	R/W - 0	U - 0
INTEDG	T0SE	T0CS	PS3	PS2	PS1	PS0	—
bit7							bit0

R = Readable bit
W = Writable bit
U = Unimplemented, reads as ‘0’
-n = Value at POR reset

bit 7: **INTEDG**: RA0/INT Pin Interrupt Edge Select bit
This bit selects the edge upon which the interrupt is detected.
1 = Rising edge of RA0/INT pin generates interrupt
0 = Falling edge of RA0/INT pin generates interrupt

bit 6: **T0SE**: Timer0 Clock Input Edge Select bit
This bit selects the edge upon which TMR0 will increment.
When T0CS = 0
1 = Rising edge of RA1/T0CKI pin increments TMR0 and/or generates a T0CKIF interrupt
0 = Falling edge of RA1/T0CKI pin increments TMR0 and/or generates a T0CKIF interrupt
When T0CS = 1
Don’t care

bit 5: **T0CS**: Timer0 Clock Source Select bit
This bit selects the clock source for Timer0.
1 = Internal instruction clock cycle (T_{CY})
0 = T0CKI pin

bit 4-1: **PS3:PS0**: Timer0 Prescale Selection bits
These bits select the prescale value for Timer0.

PS3:PS0	Prescale Value
0000	1:1
0001	1:2
0010	1:4
0011	1:8
0100	1:16
0101	1:32
0110	1:64
0111	1:128
1xxx	1:256

bit 0: **Unimplemented**: Read as '0'

6.7 Program Counter Module

The Program Counter (PC) is a 16-bit register. PCL, the low byte of the PC, is mapped in the data memory. PCL is readable and writable just as is any other register. PCH is the high byte of the PC and is not directly addressable. Since PCH is not mapped in data or program memory, an 8-bit register PCLATH (PC high latch) is used as a holding latch for the high byte of the PC. PCLATH is mapped into data memory. The user can read or write PCH through PCLATH.

The 16-bit wide PC is incremented after each instruction fetch during Q1 unless:

- Modified by `GOTO`, `CALL`, `LCALL`, `RETURN`, `RETLW`, or `RETFIE` instruction
- Modified by an interrupt response
- Due to destination write to PCL by an instruction

"Skips" are equivalent to a forced NOP cycle at the skipped address.

Figure 6-11 and Figure 6-12 show the operation of the program counter for various situations.

FIGURE 6-11: PROGRAM COUNTER OPERATION

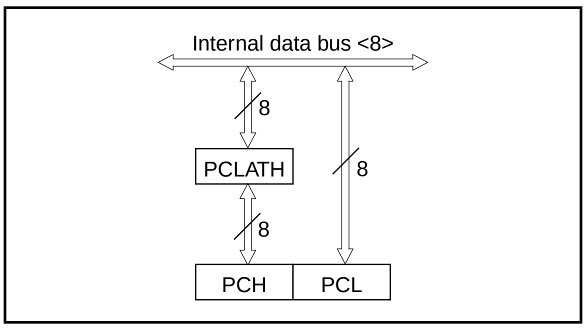


FIGURE 6-12: PROGRAM COUNTER USING THE CALL AND GOTO INSTRUCTIONS

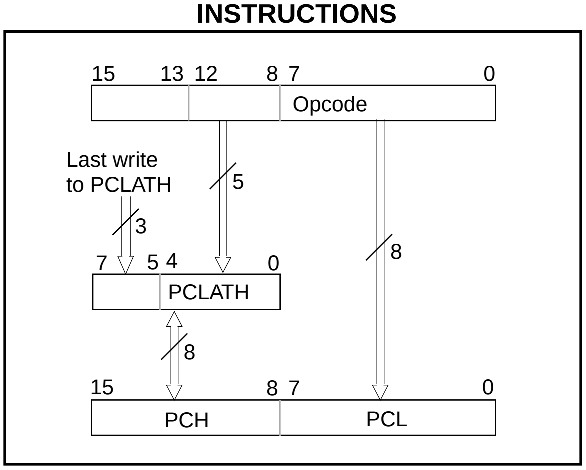

Using Figure 6-11, the operations of the PC and PCLATH for different instructions are as follows:

a) `LCALL` instructions:
An 8-bit destination address is provided in the instruction (opcode). PCLATH is unchanged.
PCLATH → PCH
Opcode<7:0> → PCL

b) Read instructions on PCL:
Any instruction that reads PCL.
PCL → data bus → ALU or destination
PCH → PCLATH

c) Write instructions on PCL:
Any instruction that writes to PCL.
8-bit data → data bus → PCL
PCLATH → PCH

d) Read-Modify-Write instructions on PCL:
Any instruction that does a read-write-modify operation on PCL, such as `ADDWF PCL`.
Read: PCL → data bus → ALU
Write: 8-bit result → data bus → PCL
PCLATH → PCH

e) `RETURN` instruction:
PCH → PCLATH
Stack<MRU> → PC<15:0>

Using Figure 6-12, the operation of the PC and PCLATH for `GOTO` and `CALL` instructions is a follows:

`CALL`, `GOTO` instructions:
A 13-bit destination address is provided in the instruction (opcode).
Opcode<12:0> → PC <12:0>
PC<15:13> → PCLATH<7:5>
Opcode<12:8> → PCLATH <4:0>

The read-modify-write only affects the PCL with the result. PCH is loaded with the value in the PCLATH. For example, `ADDWF PCL` will result in a jump within the current page. If PC = 03F0h, WREG = 30h and PCLATH = 03h before instruction, PC = 0320h after the instruction. To accomplish a true 16-bit computed jump, the user needs to compute the 16-bit destination address, write the high byte to PCLATH and then write the low value to PCL.

The following PC related operations do not change PCLATH:

a) `LCALL`, `RETLW`, and `RETFIE` instructions.
b) Interrupt vector is forced onto the PC.
c) Read-modify-write instructions on PCL (e.g. `BSF PCL`).

8.0 HARDWARE MULTIPLIER

All PIC17C4X devices except the PIC17C42, have an 8 x 8 hardware multiplier included in the ALU of the device. By making the multiply a hardware operation, it completes in a single instruction cycle. This is an unsigned multiply that gives a 16-bit result. The result is stored into the 16-bit PRODuct register (PRODH:PRODL). The multiplier does not affect any flags in the ALUSTA register.

Making the 8 x 8 multiplier execute in a single cycle gives the following advantages:

- Higher computational throughput
- Reduces code size requirements for multiply algorithms

The performance increase allows the device to be used in applications previously reserved for Digital Signal Processors.

Table 8-1 shows a performance comparison between the PIC17C42 and all other PIC17CXX devices, which have the single cycle hardware multiply.

Example 8-1 shows the sequence to do an 8 x 8 unsigned multiply. Only one instruction is required when one argument of the multiply is already loaded in the WREG register.

Example 8-2 shows the sequence to do an 8 x 8 signed multiply. To account for the sign bits of the arguments, each argument's most significant bit (MSb) is tested and the appropriate subtractions are done.

EXAMPLE 8-1: 8 x 8 MULTIPLY ROUTINE

```
MOVFP    ARG1, WREG
MULWF    ARG2           ; ARG1 * ARG2 ->
                        ;   PRODH:PRODL
```

EXAMPLE 8-2: 8 x 8 SIGNED MULTIPLY ROUTINE

```
MOVFP    ARG1, WREG
MULWF    ARG2           ; ARG1 * ARG2 ->
                        ;   PRODH:PRODL
BTFSC    ARG2, SB       ; Test Sign Bit
SUBWF    PRODH, F       ; PRODH = PRODH
                        ;         - ARG1
MOVFP    ARG2, WREG
BTFSC    ARG1, SB       ; Test Sign Bit
SUBWF    PRODH, F       ; PRODH = PRODH
                        ;         - ARG2
```

TABLE 8-1: PERFORMANCE COMPARISON

Routine	Device	Program Memory (Words)	Cycles (Max)	Time	
				@ 25 MHz	@ 33 MHz
8 x 8 unsigned	PIC17C42	13	69	11.04 µs	N/A
	All other PIC17CXX devices	1	1	160 ns	121 ns
8 x 8 signed	PIC17C42	—	—	—	N/A
	All other PIC17CXX devices	6	6	960 ns	727 ns
16 x 16 unsigned	PIC17C42	21	242	38.72 µs	N/A
	All other PIC17CXX devices	24	24	3.84 µs	2.91 µs
16 x 16 signed	PIC17C42	52	254	40.64 µs	N/A
	All other PIC17CXX devices	36	36	5.76 µs	4.36 µs

11.1 Timer0 Operation

When the T0CS (T0STA<5>) bit is set, TMR0 increments on the internal clock. When T0CS is clear, TMR0 increments on the external clock (RA1/T0CKI pin). The external clock edge can be configured in software. When the T0SE (T0STA<6>) bit is set, the timer will increment on the rising edge of the RA1/T0CKI pin. When T0SE is clear, the timer will increment on the falling edge of the RA1/T0CKI pin. The prescaler can be programmed to introduce a prescale of 1:1 to 1:256. The timer increments from 0000h to FFFFh and rolls over to 0000h. On overflow, the TMR0 Interrupt Flag bit (T0IF) is set. The TMR0 interrupt can be masked by clearing the corresponding TMR0 Interrupt Enable bit (T0IE). The TMR0 Interrupt Flag bit (T0IF) is automatically cleared when vectoring to the TMR0 interrupt vector.

11.2 Using Timer0 with External Clock

When the external clock input is used for Timer0, it is synchronized with the internal phase clocks. Figure 11-3 shows the synchronization of the external clock. This synchronization is done after the prescaler. The output of the prescaler (PSOUT) is sampled twice in every instruction cycle to detect a rising or a falling edge. The timing requirements for the external clock are detailed in the electrical specification section for the desired device.

11.2.1 DELAY FROM EXTERNAL CLOCK EDGE

Since the prescaler output is synchronized with the internal clocks, there is a small delay from the time the external clock edge occurs to the time TMR0 is actually incremented. Figure 11-3 shows that this delay is between 3TOSC and 7TOSC. Thus, for example, measuring the interval between two edges (e.g. period) will be accurate within ±4TOSC (±121 ns @ 33 MHz).

FIGURE 11-2: TIMER0 MODULE BLOCK DIAGRAM

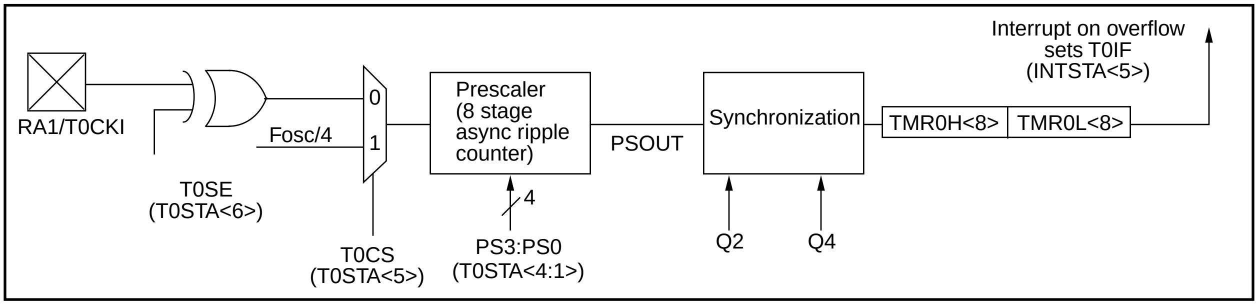

FIGURE 11-3: TMR0 TIMING WITH EXTERNAL CLOCK (INCREMENT ON FALLING EDGE)

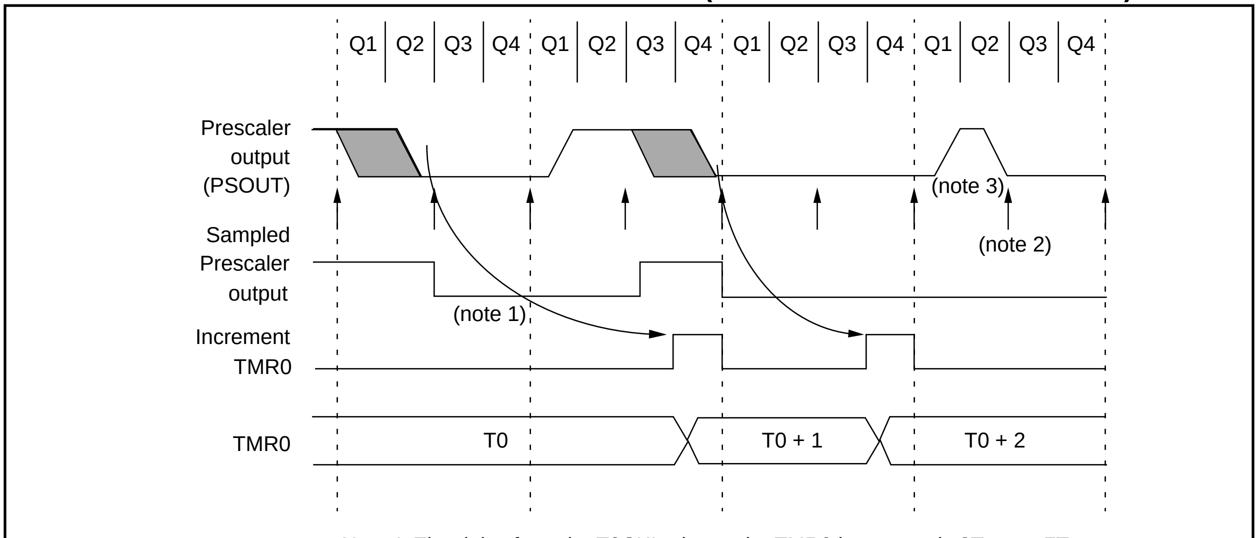

Note 1: The delay from the T0CKI edge to the TMR0 increment is 3Tosc to 7Tosc.
2: ↑ = PSOUT is sampled here.
3: The PSOUT high time is too short and is missed by the sampling circuit.

12.1.2 TIMER1 & TIMER2 IN 16-BIT MODE

To select 16-bit mode, the T16 bit must be set. In this mode TMR1 and TMR2 are concatenated to form a 16-bit timer (TMR2:TMR1). The 16-bit timer increments until it matches the 16-bit period register (PR2:PR1). On the following timer clock, the timer value is reset to 0h, and the TMR1IF bit is set.

When selecting the clock source for the16-bit timer, the TMR1CS bit controls the entire 16-bit timer and TMR2CS is a “don’t care.” When TMR1CS is clear, the timer increments once every instruction cycle (Fosc/4). When TMR1CS is set, the timer increments on every falling edge of the RB4/TCLK12 pin. For the 16-bit timer to increment, both TMR1ON and TMR2ON bits must be set (Table 12-1).

12.1.2.1 EXTERNAL CLOCK INPUT FOR TMR1:TMR2

When TMR1CS is set, the 16-bit TMR2:TMR1 increments on the falling edge of clock input TCLK12. The input on the RB4/TCLK12 pin is sampled and synchronized by the internal phase clocks twice every instruction cycle. This causes a delay from the time a falling edge appears on RB4/TCLK12 to the time TMR2:TMR1 is actually incremented. For the external clock input timing requirements, see the Electrical Specification section.

TABLE 12-1: TURNING ON 16-BIT TIMER

TMR2ON	TMR1ON	Result
1	1	16-bit timer (TMR2:TMR1) ON
0	1	Only TMR1 increments
x	0	16-bit timer OFF

FIGURE 12-4: TMR1 AND TMR2 IN 16-BIT TIMER/COUNTER MODE

Legend: x = unknown, u = unchanged, - = unimplemented read as a '0', q - value depends on condition, shaded cells are not used by Timer1 or Timer2.

Note 1: Other (non power-up) resets include: external reset through $\overline{\text{MCLR}}$ and WDT Timer Reset.

12.1.3.3.1 MAX RESOLUTION/FREQUENCY FOR EXTERNAL CLOCK INPUT

The use of an external clock for the PWM time-base (Timer1 or Timer2) limits the PWM output to a maximum resolution of 8-bits. The PWxDCL<7:6> bits must be kept cleared. Use of any other value will distort the PWM output. All resolutions are supported when internal clock mode is selected. The maximum attainable frequency is also lower. This is a result of the timing requirements of an external clock input for a timer (see the Electrical Specification section). The maximum PWM frequency, when the timers clock source is the RB4/TCLK12 pin, is shown in Table 12-3 (standard resolution mode).

12.2 Timer3

Timer3 is a 16-bit timer consisting of the TMR3H and TMR3L registers. TMR3H is the high byte of the timer and TMR3L is the low byte. This timer has an associated 16-bit period register (PR3H/CA1H:PR3L/CA1L). This period register can be software configured to be a second 16-bit capture register.

When the TMR3CS bit (TCON1<2>) is clear, the timer increments every instruction cycle (Fosc/4). When TMR3CS is set, the timer increments on every falling edge of the RB5/TCLK3 pin. In either mode, the TMR3ON bit must be set for the timer to increment. When TMR3ON is clear, the timer will not increment or set the TMR3IF bit.

Timer3 has two modes of operation, depending on the CA1/$\overline{\text{PR3}}$ bit (TCON2<3>). These modes are:

- One capture and one period register mode
- Dual capture register mode

The PIC17C4X has up to two 16-bit capture registers that capture the 16-bit value of TMR3 when events are detected on capture pins. There are two capture pins (RB0/CAP1 and RB1/CAP2), one for each capture register. The capture pins are multiplexed with PORTB pins. An event can be:

- a rising edge
- a falling edge
- every 4th rising edge
- every 16th rising edge

Each 16-bit capture register has an interrupt flag associated with it. The flag is set when a capture is made. The capture module is truly part of the Timer3 block. Figure 12-7 and Figure 12-8 show the block diagrams for the two modes of operation.

Legend: x = unknown, u = unchanged, - = unimplemented read as '0', q = value depends on conditions, shaded cells are not used by PWM.

FIGURE 13-2: RCSTA REGISTER (ADDRESS: 13h, BANK 0)

R/W - 0	R/W - 0	R/W - 0	R/W - 0	U - 0	R - 0	R - 0	R - x
SPEN	RX9	SREN	CREN	—	FERR	OERR	RX9D
bit7							bit 0

R = Readable bit
W = Writable bit
-n = Value at POR reset
(x = unknown)

bit 7: **SPEN**: Serial Port Enable bit
1 = Configures RA5/RX/DT and RA4/TX/CK pins as serial port pins
0 = Serial port disabled

bit 6: **RX9**: 9-bit Receive Enable bit
1 = Selects 9-bit reception
0 = Selects 8-bit reception

bit 5: **SREN**: Single Receive Enable bit
This bit enables the reception of a single byte. After receiving the byte, this bit is automatically cleared.
Synchronous mode:
1 = Enable reception
0 = Disable reception
Note: This bit is ignored in synchronous slave reception.
Asynchronous mode:
Don't care

bit 4: **CREN**: Continuous Receive Enable bit
This bit enables the continuous reception of serial data.
Asynchronous mode:
1 = Enable reception
0 = Disables reception
Synchronous mode:
1 = Enables continuous reception until CREN is cleared (CREN overrides SREN)
0 = Disables continuous reception

bit 3: **Unimplemented**: Read as '0'

bit 2: **FERR**: Framing Error bit
1 = Framing error (Updated by reading RCREG)
0 = No framing error

bit 1: **OERR**: Overrun Error bit
1 = Overrun (Cleared by clearing CREN)
0 = No overrun error

bit 0: **RX9D**: 9th bit of receive data (can be the software calculated parity bit)

TABLE 15-2: PIC17CXX INSTRUCTION SET (Cont.'d)

Mnemonic, Operands		Description	Cycles	16-bit Opcode MSb LSb	Status Affected	Notes
TABLWT	**t,i,f**	Table Write	2	`1010 11ti ffff ffff`	None	5
TLRD	**t,f**	Table Latch Read	1	`1010 00tx ffff ffff`	None	
TLWT	**t,f**	Table Latch Write	1	`1010 01tx ffff ffff`	None	
TSTFSZ	**f**	Test f, skip if 0	1 (2)	`0011 0011 ffff ffff`	None	6,8
XORWF	**f,d**	Exclusive OR WREG with f	1	`0000 110d ffff ffff`	Z	
BIT-ORIENTED FILE REGISTER OPERATIONS						
BCF	**f,b**	Bit Clear f	1	`1000 1bbb ffff ffff`	None	
BSF	**f,b**	Bit Set f	1	`1000 0bbb ffff ffff`	None	
BTFSC	**f,b**	Bit test, skip if clear	1 (2)	`1001 1bbb ffff ffff`	None	6,8
BTFSS	**f,b**	Bit test, skip if set	1 (2)	`1001 0bbb ffff ffff`	None	6,8
BTG	**f,b**	Bit Toggle f	1	`0011 1bbb ffff ffff`	None	
LITERAL AND CONTROL OPERATIONS						
ADDLW	**k**	ADD literal to WREG	1	`1011 0001 kkkk kkkk`	OV,C,DC,Z	
ANDLW	**k**	AND literal with WREG	1	`1011 0101 kkkk kkkk`	Z	
CALL	**k**	Subroutine Call	2	`111k kkkk kkkk kkkk`	None	7
CLRWDT	**—**	Clear Watchdog Timer	1	`0000 0000 0000 0100`	$\overline{TO}$,$\overline{PD}$	
GOTO	**k**	Unconditional Branch	2	`110k kkkk kkkk kkkk`	None	7
IORLW	**k**	Inclusive OR literal with WREG	1	`1011 0011 kkkk kkkk`	Z	
LCALL	**k**	Long Call	2	`1011 0111 kkkk kkkk`	None	4,7
MOVLB	**k**	Move literal to low nibble in BSR	1	`1011 1000 uuuu kkkk`	None	
MOVLR	**k**	Move literal to high nibble in BSR	1	`1011 101x kkkk uuuu`	None	9
MOVLW	**k**	Move literal to WREG	1	`1011 0000 kkkk kkkk`	None	
MULLW	**k**	Multiply literal with WREG	1	`1011 1100 kkkk kkkk`	None	9
RETFIE	**—**	Return from interrupt (and enable interrupts)	2	`0000 0000 0000 0101`	GLINTD	7
RETLW	**k**	Return literal to WREG	2	`1011 0110 kkkk kkkk`	None	7
RETURN	**—**	Return from subroutine	2	`0000 0000 0000 0010`	None	7
SLEEP	**—**	Enter SLEEP Mode	1	`0000 0000 0000 0011`	$\overline{TO}$, $\overline{PD}$	
SUBLW	**k**	Subtract WREG from literal	1	`1011 0010 kkkk kkkk`	OV,C,DC,Z	
XORLW	**k**	Exclusive OR literal with WREG	1	`1011 0100 kkkk kkkk`	Z	

Legend: Refer to Table 15-1 for opcode field descriptions.

Note 1: 2's Complement method.

2: Unsigned arithmetic.

3: If s = '1', only the file is affected: If s = '0', both the WREG register and the file are affected; If only the Working register (WREG) is required to be affected, then f = WREG must be specified.

4: During an `LCALL`, the contents of PCLATH are loaded into the MSB of the PC and `kkkk kkkk` is loaded into the LSB of the PC (PCL)

5: Multiple cycle instruction for EPROM programming when table pointer selects internal EPROM. The instruction is terminated by an interrupt event. When writing to external program memory, it is a two-cycle instruction.

6: Two-cycle instruction when condition is true, else single cycle instruction.

7: Two-cycle instruction except for `TABLRD` to PCL (program counter low byte) in which case it takes 3 cycles.

8: A "skip" means that instruction fetched during execution of current instruction is not executed, instead an NOP is executed.

9: These instructions are not available on the PIC17C42.

CLRWDT	**Clear Watchdog Timer**
Syntax:	[*label*] CLRWDT
Operands:	None
Operation:	00h → WDT 0 → WDT postscaler, 1 → $\overline{TO}$ 1 → $\overline{PD}$
Status Affected:	$\overline{TO}$, $\overline{PD}$
Encoding:	`0000` `0000` `0000` `0100`
Description:	`CLRWDT` instruction resets the watchdog timer. It also resets the prescaler of the WDT. Status bits $\overline{TO}$ and $\overline{PD}$ are set.
Words:	1
Cycles:	1

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register ALUSTA	Execute	NOP

Example: `CLRWDT`

Before Instruction

WDT counter	=	?

After Instruction

WDT counter	=	0x00
WDT Postscaler	=	0
$\overline{TO}$	=	1
$\overline{PD}$	=	1

COMF	**Complement f**
Syntax:	[*label*] COMF f,d
Operands:	$0 \le f \le 255$ $d \in [0,1]$
Operation:	$(\overline{f}) \rightarrow$ (dest)
Status Affected:	Z
Encoding:	`0001` `001d` `ffff` `ffff`
Description:	The contents of register 'f' are complemented. If 'd' is 0 the result is stored in WREG. If 'd' is 1 the result is stored back in register 'f'.
Words:	1
Cycles:	1

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register 'f'	Execute	Write register 'f'

Example: `COMF REG1,0`

Before Instruction

REG1	=	0x13

After Instruction

REG1	=	0x13
WREG	=	0xEC

RRNCF — Rotate Right f (no carry)

Syntax: [*label*] RRNCF f,d

Operands: $0 \le f \le 255$
$d \in [0,1]$

Operation: f<n> → d<n-1>;
f<0> → d<7>

Status Affected: None

Encoding:

`0010`	`000d`	`ffff`	`ffff`

Description: The contents of register 'f' are rotated one bit to the right. If 'd' is 0 the result is placed in WREG. If 'd' is 1 the result is placed back in register 'f'.

Words: 1

Cycles: 1

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register 'f'	Execute	Write to destination

Example 1: `RRNCF REG, 1`

Before Instruction
WREG = ?
REG = 1101 0111

After Instruction
WREG = 0
REG = 1110 1011

Example 2: `RRNCF REG, 0`

Before Instruction
WREG = ?
REG = 1101 0111

After Instruction
WREG = 1110 1011
REG = 1101 0111

SETF — Set f

Syntax: [*label*] SETF f,s

Operands: $0 \le f \le 255$
$s \in [0,1]$

Operation: FFh → f;
FFh → d

Status Affected: None

Encoding:

`0010`	`101s`	`ffff`	`ffff`

Description: If 's' is 0, both the data memory location 'f' and WREG are set to FFh. If 's' is 1 only the data memory location 'f' is set to FFh.

Words: 1

Cycles: 1

Q Cycle Activity:

Q1	Q2	Q3	Q4
Decode	Read register 'f'	Execute	Write register 'f' and other specified register

Example1: `SETF REG, 0`

Before Instruction
REG = 0xDA
WREG = 0x05

After Instruction
REG = 0xFF
WREG = 0xFF

Example2: `SETF REG, 1`

Before Instruction
REG = 0xDA
WREG = 0x05

After Instruction
REG = 0xFF
WREG = 0x05

17.2 DC CHARACTERISTICS: PIC17C42-16 (Commercial, Industrial) PIC17C42-25 (Commercial, Industrial)

DC CHARACTERISTICS		Standard Operating Conditions (unless otherwise stated) Operating temperature -40˚C ≤ TA ≤ +85˚C for industrial and 0˚C ≤ TA ≤ +70˚C for commercial Operating voltage VDD range as described in Section 17.1					
Parameter No.	**Sym**	**Characteristic**	**Min**	**Typ†**	**Max**	**Units**	**Conditions**
		Input Low Voltage					
	V_{IL}	I/O ports					
D030		with TTL buffer	V_{SS}	–	0.8	V	
D031		with Schmitt Trigger buffer	V_{SS}	–	$0.2V_{DD}$	V	
D032		$\overline{\text{MCLR}}$, OSC1 (in EC and RC mode)	Vss	–	$0.2V_{DD}$	V	Note1
D033		OSC1 (in XT, and LF mode)	–	$0.5V_{DD}$	–	V	
		Input High Voltage					
	V_{IH}	I/O ports		–			
D040		with TTL buffer	2.0	–	V_{DD}	V	
D041		with Schmitt Trigger buffer	$0.8V_{DD}$	–	V_{DD}	V	
D042		$\overline{\text{MCLR}}$	$0.8V_{DD}$	–	V_{DD}	V	Note1
D043		OSC1 (XT, and LF mode)	–	$0.5V_{DD}$	–	V	
D050	V_{HYS}	Hysteresis of Schmitt Trigger inputs	$0.15V_{DD}$*	–	–	V	
		Input Leakage Current (Notes 2, 3)					
D060	I_{IL}	I/O ports (except RA2, RA3)	–	–	±1	µA	$V_{SS} \le V_{PIN} \le V_{DD}$, I/O Pin at hi-impedance PORTB weak pull-ups disabled
D061		$\overline{\text{MCLR}}$	–	–	±2	µA	$V_{PIN} = V_{SS}$ or $V_{PIN} = V_{DD}$
D062		RA2, RA3			±2	µA	$V_{SS} \le V_{RA2}, V_{RA3} \le 12V$
D063		OSC1, TEST	–	–	±1	µA	$V_{SS} \le V_{PIN} \le V_{DD}$
D064		$\overline{\text{MCLR}}$	–	–	10	µA	$V_{MCLR} = V_{PP} = 12V$ (when not programming)
D070	I_{PURB}	PORTB weak pull-up current	60	200	400	µA	$V_{PIN} = V_{SS}$, $\overline{\text{RBPU}} = 0$

* These parameters are characterized but not tested.

† Data in “Typ” column is at 5V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

‡ These parameters are for design guidance only and are not tested, nor characterized.

†† Design guidance to attain the AC timing specifications. These loads are not tested.

Note 1: In RC oscillator configuration, the OSC1 pin is a Schmitt Trigger input. It is not recommended that the PIC17CXX devices be driven with external clock in RC mode.

2: The leakage current on the $\overline{\text{MCLR}}$ pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.

3: Negative current is defined as coming out of the pin.

4: These specifications are for the programming of the on-chip program memory EPROM through the use of the table write instructions. The complete programming specifications can be found in: PIC17CXX Programming Specifications (Literature number DS30139).

5: The $\overline{\text{MCLR}}$/Vpp pin may be kept in this range at times other than programming, but this is not recommended.

6: For TTL buffers, the better of the two specifications may be used.

E.6 PIC16C8X Family of Devices

	Clock	Memory					Peripherals	Features			
	Maximum Frequency of Operation (MHz)	Program Memory: Flash	Program Memory: EEPROM	Program Memory: ROM	Data Memory (bytes)	Data EEPROM (bytes)	Timer Module(s)	Interrupt Sources	I/O Pins	Voltage Range (Volts)	Packages
PIC16C84	10	—	1K	—	36	64	TMR0	4	13	2.0-6.0	18-pin DIP, SOIC
PIC16F84[(1)]	10	1K	—	—	68	64	TMR0	4	13	2.0-6.0	18-pin DIP, SOIC
PIC16CR84[(1)]	10	—	—	1K	68	64	TMR0	4	13	2.0-6.0	18-pin DIP, SOIC
PIC16F83[(1)]	10	512	—	—	36	64	TMR0	4	13	2.0-6.0	18-pin DIP, SOIC
PIC16CR83[(1)]	10	—	—	512	36	64	TMR0	4	13	2.0-6.0	18-pin DIP, SOIC

All PIC16/17 family devices have Power-on Reset, selectable Watchdog Timer, selectable code protect, and high I/O current capability.

All PIC16C8X family devices use serial programming with clock pin RB6 and data pin RB7.

Note 1: Please contact your local sales office for availability of these devices.

PIC17C4X Product Identification System

To order or to obtain information, e.g., on pricing or delivery, please use the listed part numbers, and refer to the factory or the listed sales offices.

PART NO. – XX X /XX XXX

Pattern:	QTP, SQTP, ROM Code (factory specified) or Special Requirements. Blank for OTP and Windowed devices	
Package:	P	= PDIP
	JW	= Windowed CERDIP
	P	= PDIP (600 mil)
	PQ	= MQFP
	PT	= TQFP
	L	= PLCC
Temperature Range:	–	= 0˚C to +70˚C
	I	= –40˚C to +85˚C
Frequency Range:	08	= 8 MHz
	16	= 16 MHz
	25	= 25 Mhz
	33	= 33 Mhz
Device:	PIC17C44	: Standard Vdd range
	PIC17C44T	: (Tape and Reel)
	PIC17LC44	: Extended Vdd range

Examples

a) PIC17C42 – 16/P Commercial Temp., PDIP package, 16 MHZ, normal V_{DD} limits

b) PIC17LC44 – 08/PT Commercial Temp., TQFP package, 8MHz, extended V_{DD} limits

c) PIC17C43 – 25I/P Industrial Temp., PDIP package, 25 MHz, normal V_{DD} limits

Sales and Support

Products supported by a preliminary Data Sheet may possibly have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office (see below)
2. The Microchip Corporate Literature Center U.S. FAX: (602) 786-7277
3. The Microchip's Bulletin Board, via your local CompuServe number (CompuServe membership NOT required).

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.
For latest version information and upgrade kits for Microchip Development Tools, please call 1-800-755-2345 or 1-602-786-7302.

Note the following details of the code protection feature on PICmicro® MCUs.

- The PICmicro family meets the specifications contained in the Microchip Data Sheet.
- Microchip believes that its family of PICmicro microcontrollers is one of the most secure products of its kind on the market today, when used in the intended manner and under normal conditions.
- There are dishonest and possibly illegal methods used to breach the code protection feature. All of these methods, to our knowledge, require using the PICmicro microcontroller in a manner outside the operating specifications contained in the data sheet. The person doing so may be engaged in theft of intellectual property.
- Microchip is willing to work with the customer who is concerned about the integrity of their code.
- Neither Microchip nor any other semiconductor manufacturer can guarantee the security of their code. Code protection does not mean that we are guaranteeing the product as “unbreakable”.
- Code protection is constantly evolving. We at Microchip are committed to continuously improving the code protection features of our product.

If you have any further questions about this matter, please contact the local sales office nearest to you.

DNV Certification, Inc. USA
ANSI • RAB ACCREDITED QMS
DNV
DNV MSC The Netherlands Accredited by the RvA
ISO 9001 / QS-9000 REGISTERED FIRM

Microchip received QS-9000 quality system certification for its worldwide headquarters, design and wafer fabrication facilities in Chandler and Tempe, Arizona in July 1999. The Company’s quality system processes and procedures are QS-9000 compliant for its PICmicro® 8-bit MCUs, KEELOQ® code hopping devices, Serial EEPROMs and microperipheral products. In addition, Microchip’s quality system for the design and manufacture of development systems is ISO 9001 certified.
