

Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "<u>Embedded -</u> <u>Microcontrollers</u>"

Details

Product Status	Obsolete
Core Processor	PIC
Core Size	8-Bit
Speed	16MHz
Connectivity	UART/USART
Peripherals	POR, PWM, WDT
Number of I/O	33
Program Memory Size	4KB (2K x 16)
Program Memory Type	ОТР
EEPROM Size	-
RAM Size	232 x 8
Voltage - Supply (Vcc/Vdd)	4.5V ~ 6V
Data Converters	-
Oscillator Type	External
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	44-QFP
Supplier Device Package	44-MQFP (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic17c42at-16i-pq

Email: info@E-XFL.COM

Address: Room A, 16/F, Full Win Commercial Centre, 573 Nathan Road, Mongkok, Hong Kong

4.0 RESET

The PIC17CXX differentiates between various kinds of reset:

- Power-on Reset (POR)
- MCLR reset during normal operation
- WDT Reset (normal operation)

Some registers are not affected in any reset condition; their status is unknown on POR and unchanged in any other reset. Most other registers are forced to a "reset state" on Power-on Reset (POR), on $\overline{\text{MCLR}}$ or WDT Reset and on $\overline{\text{MCLR}}$ reset during SLEEP. They are not affected by a WDT Reset during SLEEP, since this reset is viewed as the resumption of normal operation. The $\overline{\text{TO}}$ and $\overline{\text{PD}}$ bits are set or cleared differently in different reset situations as indicated in Table 4-3. These bits are used in software to determine the nature of reset. See Table 4-4 for a full description of reset states of all registers.

Note: While the device is in a reset state, the internal phase clock is held in the Q1 state. Any processor mode that allows external execution will force the RE0/ALE pin as a low output and the RE1/OE and RE2/WR pins as high outputs.

A simplified block diagram of the on-chip reset circuit is shown in Figure 4-1.

4.1 <u>Power-on Reset (POR), Power-up</u> <u>Timer (PWRT), and Oscillator Start-up</u> <u>Timer (OST)</u>

4.1.1 POWER-ON RESET (POR)

The Power-on Reset circuit holds the device in reset until VDD is above the trip point (in the range of 1.4V -2.3V). The PIC17C42 does not produce an internal reset when VDD declines. All other devices will produce an internal reset for both rising and falling VDD. To take advantage of the POR, just tie the MCLR/VPP pin directly (or through a resistor) to VDD. This will eliminate external RC components usually needed to create Power-on Reset. A minimum rise time for VDD is required. See Electrical Specifications for details.

4.1.2 POWER-UP TIMER (PWRT)

The Power-up Timer provides a fixed 96 ms time-out (nominal) on power-up. This occurs from rising edge of the POR signal and after the first rising edge of $\overline{\text{MCLR}}$ (detected high). The Power-up Timer operates on an internal RC oscillator. The chip is kept in RESET as long as the PWRT is active. In most cases the PWRT delay allows the VDD to rise to an acceptable level.

The power-up time delay will vary from chip to chip and to VDD and temperature. See DC parameters for details.

FIGURE 4-1: SIMPLIFIED BLOCK DIAGRAM OF ON-CHIP RESET CIRCUIT

5.9 Context Saving During Interrupts

During an interrupt, only the returned PC value is saved on the stack. Typically, users may wish to save key registers during an interrupt; e.g. WREG, ALUSTA and the BSR registers. This requires implementation in software. Example 5-1 shows the saving and restoring of information for an interrupt service routine. The PUSH and POP routines could either be in each interrupt service routine or could be subroutines that were called. Depending on the application, other registers may also need to be saved, such as PCLATH.

EXAMPLE 5-1: SAVING STATUS AND WREG IN RAM

POP	MOVFP MOVFP MOVFP RETFIE	TEMP_W, WREG TEMP_STATUS, ALUSTA TEMP_BSR, BSR		

6.0 MEMORY ORGANIZATION

There are two memory blocks in the PIC17C4X; program memory and data memory. Each block has its own bus, so that access to each block can occur during the same oscillator cycle.

The data memory can further be broken down into General Purpose RAM and the Special Function Registers (SFRs). The operation of the SFRs that control the "core" are described here. The SFRs used to control the peripheral modules are described in the section discussing each individual peripheral module.

6.1 Program Memory Organization

PIC17C4X devices have a 16-bit program counter capable of addressing a 64K x 16 program memory space. The reset vector is at 0000h and the interrupt vectors are at 0008h, 0010h, 0018h, and 0020h (Figure 6-1).

6.1.1 PROGRAM MEMORY OPERATION

The PIC17C4X can operate in one of four possible program memory configurations. The configuration is selected by two configuration bits. The possible modes are:

- Microprocessor
- Microcontroller
- Extended Microcontroller
- Protected Microcontroller

The microcontroller and protected microcontroller modes only allow internal execution. Any access beyond the program memory reads unknown data. The protected microcontroller mode also enables the code protection feature.

The extended microcontroller mode accesses both the internal program memory as well as external program memory. Execution automatically switches between internal and external memory. The 16-bits of address allow a program memory range of 64K-words.

The microprocessor mode only accesses the external program memory. The on-chip program memory is ignored. The 16-bits of address allow a program memory range of 64K-words. Microprocessor mode is the default mode of an unprogrammed device.

The different modes allow different access to the configuration bits, test memory, and boot ROM. Table 6-1 lists which modes can access which areas in memory. Test Memory and Boot Memory are not required for normal operation of the device. Care should be taken to ensure that no unintended branches occur to these areas.

6.1.2 EXTERNAL MEMORY INTERFACE

When either microprocessor or extended microcontroller mode is selected, PORTC, PORTD and PORTE are configured as the system bus. PORTC and PORTD are the multiplexed address/data bus and PORTE is for the control signals. External components are needed to demultiplex the address and data. This can be done as shown in Figure 6-4. The waveforms of address and data are shown in Figure 6-3. For complete timings, please refer to the electrical specification section.

FIGURE 6-3: EXTERNAL PROGRAM MEMORY ACCESS WAVEFORMS

:	Q1 Q2 Q3 Q4	Q1 Q2 Q3 Q4 Q1
AD	X	
<15:0>	Address out Data in	Address out Data out
ALE		
OE;	'4'	· · · ·
WR	'1'	<u> </u>
	Read cycle	Write cycle
		, white cycle

The system bus requires that there is no bus conflict (minimal leakage), so the output value (address) will be capacitively held at the desired value.

As the speed of the processor increases, external EPROM memory with faster access time must be used. Table 6-2 lists external memory speed requirements for a given PIC17C4X device frequency.

In extended microcontroller mode, when the device is executing out of internal memory, the control signals will continue to be active. That is, they indicate the action that is occurring in the internal memory. The external memory access is ignored.

This following selection is for use with Microchip EPROMs. For interfacing to other manufacturers memory, please refer to the electrical specifications of the desired PIC17C4X device, as well as the desired memory device to ensure compatibility.

TABLE 6-2:	EPROM MEMORY ACCESS
	TIME ORDERING SUFFIX

PIC17C4X	Instruction	EPRON	I Suffix
Oscillator Frequency	Cycle Time (Tcy)	PIC17C42	PIC17C43 PIC17C44
8 MHz	500 ns	-25	-25
16 MHz	250 ns	-12	-15
20 MHz	200 ns	-90	-10
25 MHz	160 ns	N.A.	-70
33 MHz	121 ns	N.A.	(1)

Note 1: The access times for this requires the use of fast SRAMS.

Note: The external memory interface is not supported for the LC devices.

FIGURE 6-4: TYPICAL EXTERNAL PROGRAM MEMORY CONNECTION DIAGRAM

8.0 HARDWARE MULTIPLIER

All PIC17C4X devices except the PIC17C42, have an 8 x 8 hardware multiplier included in the ALU of the device. By making the multiply a hardware operation, it completes in a single instruction cycle. This is an unsigned multiply that gives a 16-bit result. The result is stored into the 16-bit PRODuct register (PRODH:PRODL). The multiplier does not affect any flags in the ALUSTA register.

Making the 8 x 8 multiplier execute in a single cycle gives the following advantages:

- Higher computational throughput
- Reduces code size requirements for multiply algorithms

The performance increase allows the device to be used in applications previously reserved for Digital Signal Processors.

Table 8-1 shows a performance comparison between the PIC17C42 and all other PIC17CXX devices, which have the single cycle hardware multiply.

Example 8-1 shows the sequence to do an 8 x 8 unsigned multiply. Only one instruction is required when one argument of the multiply is already loaded in the WREG register.

Example 8-2 shows the sequence to do an 8×8 signed multiply. To account for the sign bits of the arguments, each argument's most significant bit (MSb) is tested and the appropriate subtractions are done.

EXAMPLE 8-1: 8 x 8 MULTIPLY ROUTINE

Legend: x = unknown, u = unchanged.

Note 1: Other (non power-up) resets include: external reset through MCLR and the Watchdog Timer Reset.

12.1 <u>Timer1 and Timer2</u>

12.1.1 TIMER1, TIMER2 IN 8-BIT MODE

Both Timer1 and Timer2 will operate in 8-bit mode when the T16 bit is clear. These two timers can be independently configured to increment from the internal instruction cycle clock or from an external clock source on the RB4/TCLK12 pin. The timer clock source is configured by the TMRxCS bit (x = 1 for Timer1 or = 2 for Timer2). When TMRxCS is clear, the clock source is internal and increments once every instruction cycle (Fosc/4). When TMRxCS is set, the clock source is the RB4/TCLK12 pin, and the timer will increment on every falling edge of the RB4/TCLK12 pin.

The timer increments from 00h until it equals the Period register (PRx). It then resets to 00h at the next increment cycle. The timer interrupt flag is set when the timer is reset. TMR1 and TMR2 have individual interrupt flag bits. The TMR1 interrupt flag bit is latched into TMR1IF, and the TMR2 interrupt flag bit is latched into TMR2IF.

Each timer also has a corresponding interrupt enable bit (TMRxIE). The timer interrupt can be enabled by setting this bit and disabled by clearing this bit. For peripheral interrupts to be enabled, the Peripheral Interrupt Enable bit must be enabled (PEIE is set) and global interrupts must be enabled (GLINTD is cleared).

The timers can be turned on and off under software control. When the Timerx On control bit (TMRxON) is set, the timer increments from the clock source. When TMRxON is cleared, the timer is turned off and cannot cause the timer interrupt flag to be set.

12.1.1.1 EXTERNAL CLOCK INPUT FOR TIMER1 OR TIMER2

When TMRxCS is set, the clock source is the RB4/TCLK12 pin, and the timer will increment on every falling edge on the RB4/TCLK12 pin. The TCLK12 input is synchronized with internal phase clocks. This causes a delay from the time a falling edge appears on TCLK12 to the time TMR1 or TMR2 is actually incremented. For the external clock input timing requirements, see the Electrical Specification section.

FIGURE 12-3: TIMER1 AND TIMER2 IN TWO 8-BIT TIMER/COUNTER MODE

14.4.2 MINIMIZING CURRENT CONSUMPTION

To minimize current consumption, all I/O pins should be either at VDD, or VSS, with no external circuitry drawing current from the I/O pin. I/O pins that are hi-impedance inputs should be pulled high or low externally to avoid switching currents caused by floating inputs. The TOCKI input should be at VDD or VSS. The contributions from on-chip pull-ups on PORTB should also be considered, and disabled when possible.

14.5 <u>Code Protection</u>

The code in the program memory can be protected by selecting the microcontroller in code protected mode (PM2:PM0 = '000').

Note:	PM2 d	oes not	exist on th	e PIC17C42. To
	select	code	protected	microcontroller
			10 = 00'.	

In this mode, instructions that are in the on-chip program memory space, can continue to read or write the program memory. An instruction that is executed outside of the internal program memory range will be inhibited from writing to or reading from program memory.

Note: Microchip does not recommend code protecting windowed devices.

If the code protection bit(s) have not been programmed, the on-chip program memory can be read out for verification purposes.

TABLE 15-2: PIC17CXX INSTRUCTION SET

Mnemonic, Operands		Description	Cycles	16-bit Opcoo	le	Status	Notes

Legend: Refer to Table 15-1 for opcode field descriptions.

- Note 1: 2's Complement method.
 - 2: Unsigned arithmetic.

3: If s = '1', only the file is affected: If s = '0', both the WREG register and the file are affected; If only the Working register (WREG) is required to be affected, then f = WREG must be specified.

- 4: During an LCALL, the contents of PCLATH are loaded into the MSB of the PC and kkkk kkkk is loaded into the LSB of the PC (PCL)
- 5: Multiple cycle instruction for EPROM programming when table pointer selects internal EPROM. The instruction is terminated by an interrupt event. When writing to external program memory, it is a two-cycle instruction.
- 6: Two-cycle instruction when condition is true, else single cycle instruction.
- 7: Two-cycle instruction except for TABLRD to PCL (program counter low byte) in which case it takes 3 cycles.
- 8: A "skip" means that instruction fetched during execution of current instruction is not executed, instead an NOP is executed.
- 9: These instructions are not available on the PIC17C42.

MOVLR	Move Literal to high nibble in BSR						
Syntax:	[<i>label</i>] MOVLR k						
Operands:	$0 \le k \le 15$						
Operation:	$k \rightarrow (BSR < 7:4>)$						
Status Affected:	None						
Encoding:	1011 101x kkkk uuuu						
Description:	The 4-bit literal 'k' is loaded into the most significant 4-bits of the Bank Select Register (BSR). Only the high 4-bits of the Bank Select Register are affected. The lower half of the BSR is unchanged. The assembler will encode the "u" fields as 0.						
Words:	1						
Cycles:	1						
Q Cycle Activity:							
Q1	Q2 Q3 Q4						
Decode	Read literal Execute Write 'k:u' literal 'k' to BSR<7:4>						
Example:	MOVLR 5						
Before Instruc BSR regis After Instructi	ster = 0x22						
BSR regis							
	nstruction is not available in the C42 device.						

MOVLW	Move Literal to WREG
Syntax:	[<i>label</i>] MOVLW k
Operands:	$0 \le k \le 255$
Operation:	$k \rightarrow (WREG)$
Status Affected:	None
Encoding:	1011 0000 kkkk kkkk
Description:	The eight bit literal 'k' is loaded into WREG.
Words:	1
Cycles:	1
Q Cycle Activity:	
Q1	Q2 Q3 Q4
Decode	Read Execute Write to literal 'k' WREG
Example:	MOVLW 0x5A
After Instruc WREG

MOVPF	Move p to f						
Syntax:	[<i>label</i>] MOVPF p,f						
Operands:	$\begin{array}{l} 0 \leq f \leq 255 \\ 0 \leq p \leq 31 \end{array}$						
Operation:	$(p) \rightarrow (f)$						
Status Affected:	Z						
Encoding:	010p pppp ffff ffff						
Description:	Move data from data memory location 'p' to data memory location 'f'. Location 'f' can be anywhere in the 256 byte data space (00h to FFh) while 'p' can be 00h to 1Fh.						
	Either 'p' or 'f' can be WREG (a useful special situation).						
	MOVPF is particularly useful for transfer- ring a peripheral register (e.g. the timer or an I/O port) to a data memory loca- tion. Both 'f' and 'p' can be indirectly addressed.						
Words:	1						
Cycles:	1						
Q Cycle Activity:							
Q1	Q2 Q3 Q4						
Decode	ReadExecuteWriteregister 'p'register 'f'						
Example:	MOVPF REG1, REG2						
Before Instru	iction						
REG1 REG2	= 0x11 = 0x33						
After Instruc REG1 REG2	ion = 0x11 = 0x11						

MOVWF		Ν	Move WREG to f							
Synt	ax:	[/	label]	MOVWF	= f					
Ope	rands:	0	≤ f ≤ 25	5						
Ope	ration:	(\	VREG) ·	\rightarrow (f)						
State	us Affected:	N	one							
Enco	oding:		0000	0001	fff	f	ffff			
Des	cription:	Lo		from WR can be a space.		•

TABLE 16-1: DEVELOPMENT TOOLS FROM MICROCHIP

Applicable Devices 42 R42 42A 43 R43 44

19.2 **DC CHARACTERISTICS:**

PIC17LC42A/43/LC44 (Commercial, Industrial) PIC17LCR42/43 (Commercial, Industrial)

DC CHARA	Standard Operating		•		s (unless otherwise stated) $\leq TA \leq +85^{\circ}C$ for industrial and $\leq TA \leq +70^{\circ}C$ for commercial		
Parameter No.	Sym	Characteristic	Min	Тур†	Мах	Units	Conditions
D001	Vdd	Supply Voltage	2.5	_	6.0	V	
D002	Vdr	RAM Data Retention Voltage (Note 1)	1.5 *	-	Ι	V	Device in SLEEP mode
D003	VPOR	VDD start voltage to ensure internal Power-on Reset signal	_	Vss	_	V	See section on Power-on Reset for details
D004	SVDD	VDD rise rate to ensure internal Power-on Reset signal	0.060 *	_	Ι	mV/ms	See section on Power-on Reset for details
D010	IDD	Supply Current	-	3	6	mA	Fosc = 4 MHz (Note 4)
D011		(Note 2)	-	6	12 *	mA	Fosc = 8 MHz
D014			-	95	150	μA	Fosc = 32 kHz,
							WDT disabled (EC osc configuration)
D020	IPD	Power-down	-	10	40	μA	VDD = 5.5V, WDT enabled
D021		Current (Note 3)	-	< 1	5	μA	VDD = 5.5V, WDT disabled

These parameters are characterized but not tested.

+ Data in "Typ" column is at 5V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

Note 1: This is the limit to which VDD can be lowered in SLEEP mode without losing RAM data.

2: The supply current is mainly a function of the operating voltage and frequency. Other factors such as I/O pin loading and switching rate, oscillator type, internal code execution pattern, and temperature also have an impact on the current consumption.

The test conditions for all IDD measurements in active operation mode are:

OSC1=external square wave, from rail to rail; all I/O pins tristated, pulled to VDD or VSS, TOCKI = VDD, MCLR = VDD; WDT enabled/disabled as specified.

Current consumed from the oscillator and I/O's driving external capacitive or resistive loads needs to be considered.

For the RC oscillator, the current through the external pull-up resistor (R) can be estimated as: VbD / (2 • R). For capacitive loads, the current can be estimated (for an individual I/O pin) as (CL • VDD) • f

CL = Total capacitive load on the I/O pin; f = average frequency the I/O pin switches.

The capacitive currents are most significant when the device is configured for external execution (includes extended microcontroller mode).

- 3: The power down current in SLEEP mode does not depend on the oscillator type. Power-down current is measured with the part in SLEEP mode, with all I/O pins in hi-impedance state and tied to VDD or VSS.
- 4: For RC osc configuration, current through Rext is not included. The current through the resistor can be estimated by the formula IR = VDD/2Rext (mA) with Rext in kOhm.

Standard Operating Conditions (unloss otherwise stated)

Applicable Devices 42 R42 42A 43 R43 44

Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 Timing Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 69
Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 Timing Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 16-bit Read 69 16-bit Write 69
Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 Timing Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 69
Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 Timing Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 16-bit Read 69 16-bit Write 69
Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 Timing Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 16-bit Read 69 16-bit Write 69 Clock Timing 158 Module 68
Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 Timing Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 16-bit Read 69 16-bit Write 69 Clock Timing 158 Module 68 Operation 68
Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 Timing Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 16-bit Read 69 16-bit Write 69 Clock Timing 158 Module 68 Operation 68 Overview 65
Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 Timing Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 69 16-bit Read 69 16-bit Write 69 Clock Timing 158 Module 68 Operation 68 Overview 65 Prescaler Assignments 69
Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 Timing Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 16-bit Read 69 16-bit Write 69 Clock Timing 158 Module 68 Operation 68 Overview 65 Prescaler Assignments 69 Read/Write Considerations 69
Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 Timing Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 69 16-bit Read 69 16-bit Write 69 Clock Timing 158 Module 68 Operation 68 Overview 65 Prescaler Assignments 69 Read/Write Considerations 69 Read/Write in Timer Mode 70
Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 Timing Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 69 16-bit Read 69 16-bit Write 69 Clock Timing 158 Module 68 Operation 68 Overview 65 Prescaler Assignments 69 Read/Write Considerations 69 Read/Write in Timer Mode 70 Timing 68, 69
Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 Timing Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 69 16-bit Read 69 16-bit Write 69 Clock Timing 158 Module 68 Operation 68 Overview 65 Prescaler Assignments 69 Read/Write Considerations 69 Read/Write in Timer Mode 70
Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 Timing Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 69 16-bit Read 69 16-bit Write 69 Clock Timing 158 Module 68 Operation 68 Overview 65 Prescaler Assignments 69 Read/Write Considerations 69 Read/Write in Timer Mode 70 Timing 68, 69
Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 Timing Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 69 16-bit Read 69 16-bit Write 69 Clock Timing 158 Module 68 Operation 68 Overview 65 Prescaler Assignments 69 Read/Write Considerations 69 Read/Write in Timer Mode 70 Timing 68, 69 TMR0 STATUS/Control Register (TOSTA) 38
Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 Timing Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 69 16-bit Read 69 16-bit Write 69 Clock Timing 158 Module 68 Operation 68 Overview 65 Prescaler Assignments 69 Read/Write Considerations 69 Read/Write in Timer Mode 70 Timing 68, 69 TMR0 STATUS/Control Register (TOSTA) 38 TMR0L 34
Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 Timing Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 69 16-bit Read 69 16-bit Write 69 Clock Timing 158 Module 68 Operation 68 Overview 65 Prescaler Assignments 69 Read/Write in Timer Mode 70 Timing 68, 69 TMR0 STATUS/Control Register (TOSTA) 38 TMR0L 34 TMR0L 34
Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 TIMIN Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 16-bit Read 16-bit Read 69 16-bit Write 69 Clock Timing 158 Module 68 Operation 68 Overview 65 Prescaler Assignments 69 Read/Write Considerations 69 TIMR0 STATUS/Control Register (TOSTA) 38 TMR0L 34 TMR0L 34
Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 TIMIN Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 16-bit Read 69 16-bit Write 69 Clock Timing 158 Module 68 Operation 68 Overview 65 Prescaler Assignments 69 Read/Write Considerations 69 TIMR0 STATUS/Control Register (TOSTA) 38 TMR0L 34 TMR0L 34 TMR0L 34
Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 Timing Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 16-bit Read 69 16-bit Write 69 Clock Timing 158 Module 68 Operation 68 Overview 65 Prescaler Assignments 69 Read/Write In Timer Mode 70 Timing 68 MR0 STATUS/Control Register (TOSTA) 38 TMR0L 34 TMR0L 34 TMR0L 73 External Clock Input 73 Overview 65
Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 Timing Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 16-bit Read 16-bit Write 69 Clock Timing 158 Module 68 Operation 68 Overview 65 Prescaler Assignments 69 Read/Write Considerations 69 Read/Write in Timer Mode 70 Timing 68, 69 TMRO STATUS/Control Register (TOSTA) 34 TMROL 34 TMROL 73 Overview 73 S-bit Mode 73 External Clock Input 73 Overview 74 TIMROL 34
Table Write 46 TMR0 68, 69 TMR0 Read/Write in Timer Mode 70 TMR1, TMR2, and TMR3 in External Clock Mode 80 TMR1, TMR2, and TMR3 in Timer Mode 81 Wake-Up from SLEEP 105 Timing Diagrams and Specifications 155 Timing Parameter Symbology 153 TLRD 44, 139 TLWT 43, 140 TMR0 16-bit Read 69 16-bit Write 69 Clock Timing 158 Module 68 Operation 68 Overview 65 Prescaler Assignments 69 Read/Write In Timer Mode 70 Timing 68 MR0 STATUS/Control Register (TOSTA) 38 TMR0L 34 TMR0L 34 TMR0L 73 External Clock Input 73 Overview 65
