What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

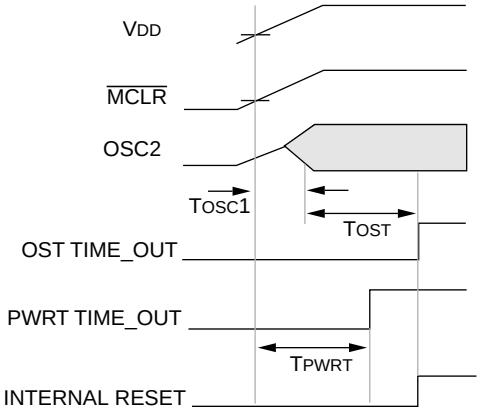
FIGURE 4-5: OSCILLATOR START-UPTIME



This figure shows in greater detail the timings involved with the oscillator start-up timer. In this example the low frequency crystal start-up time is larger than power-up time (TPWRT).
Tosc1 = time for the crystal oscillator to react to an oscillation level detectable by the Oscillator Start-up Timer (ost).
TOST = 1024TOSC.

FIGURE 4-6: USING ON-CHIP POR

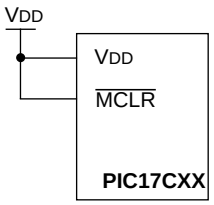


FIGURE 4-7: BROWN-OUT PROTECTION CIRCUIT 1

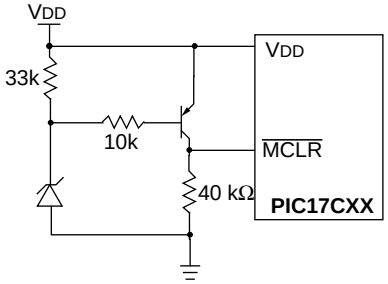
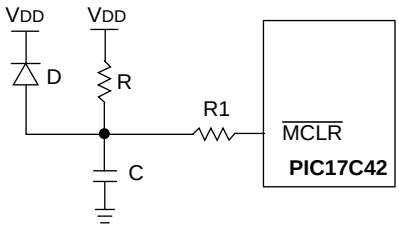


This circuit will activate reset when VDD goes below (Vz + 0.7V) where Vz = Zener voltage.

FIGURE 4-8: PIC17C42 EXTERNAL POWER-ON RESET CIRCUIT (FOR SLOW VDD POWER-UP)

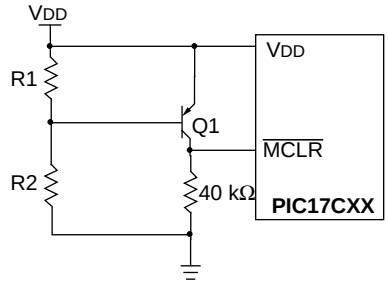


Note 1: An external Power-on Reset circuit is required only if VDD power-up time is too slow. The diode D helps discharge the capacitor quickly when VDD powers down.

2: R < 40 kΩ is recommended to ensure that the voltage drop across R does not exceed 0.2V (max. leakage current spec. on the MCLR/VPP pin is 5 μA). A larger voltage drop will degrade VIH level on the MCLR/VPP pin.

3: R1 = 100Ω to 1 kΩ will limit any current flowing into MCLR from external capacitor C in the event of MCLR/VPP pin breakdown due to Electrostatic Discharge (ESD) or (Electrical Overstress) EOS.

FIGURE 4-9: BROWN-OUT PROTECTION CIRCUIT 2



This brown-out circuit is less expensive, albeit less accurate. Transistor Q1 turns off when VDD is below a certain level such that:

$$V_{DD} \bullet \frac{R1}{R1 + R2} = 0.7V$$

Note 1: The upper byte of the program counter is not directly accessible. PCLATH is a holding register for PC<15:8> whose contents are updated from or transferred to the upper byte of the program counter.

2: The $\overline{TO}$ and $\overline{PD}$ status bits in CPUSTA are not affected by a MCLR reset.

3: Other (non power-up) resets include: external reset through MCLR and the Watchdog Timer Reset.

4: The following values are for both TBLPTRL and TBLPTRH:
All PIC17C4X devices (Power-on Reset 0000 0000) and (All other resets 0000 0000)
except the PIC17C42 (Power-on Reset xxxx xxxx) and (All other resets uuuu uuuu)

5: The PRODL and PRODH registers are not implemented on the PIC17C42.

6.2.2.2 CPU STATUS REGISTER (CPUSTA)

The CPUSTA register contains the status and control bits for the CPU. This register is used to globally enable/disable interrupts. If only a specific interrupt is desired to be enabled/disabled, please refer to the INTerrupt STAtus (INTSTA) register and the Peripheral Interrupt Enable (PIE) register. This register also indicates if the stack is available and contains the Power-down ($\overline{PD}$) and Time-out ($\overline{TO}$) bits. The $\overline{TO}$, $\overline{PD}$, and STKAV bits are not writable. These bits are set and cleared according to device logic. Therefore, the result of an instruction with the CPUSTA register as destination may be different than intended.

R = Readable bit
W = Writable bit
U = Unimplemented bit, Read as '0'
- n = Value at POR reset

bit 7-6: **Unimplemented**: Read as '0'

bit 5: **STKAV**: Stack Available bit
This bit indicates that the 4-bit stack pointer value is Fh, or has rolled over from Fh→ 0h (stack overflow).
1 = Stack is available
0 = Stack is full, or a stack overflow may have occurred (Once this bit has been cleared by a stack overflow, only a device reset will set this bit)

bit 4: **GLINTD**: Global Interrupt Disable bit
This bit disables all interrupts. When enabling interrupts, only the sources with their enable bits set can cause an interrupt.
1 = Disable all interrupts
0 = Enables all un-masked interrupts

bit 3: **$\overline{TO}$**: WDT Time-out Status bit
1 = After power-up or by a CLRWDT instruction
0 = A Watchdog Timer time-out occurred

bit 2: **$\overline{PD}$**: Power-down Status bit
1 = After power-up or by the CLRWDT instruction
0 = By execution of the SLEEP instruction

bit 1-0: **Unimplemented**: Read as '0'

16.9 MPLAB Integrated Development Environment Software

The MPLAB IDE Software brings an ease of software development previously unseen in the 8-bit microcontroller market. MPLAB is a windows based application which contains:

- A full featured editor
- Three operating modes
  - editor
  - emulator
  - simulator
- A project manager
- Customizable tool bar and key mapping
- A status bar with project information
- Extensive on-line help

MPLAB allows you to:

- Edit your source files (either assembly or 'C')
- One touch assemble (or compile) and download to PIC16/17 tools (automatically updates all project information)
- Debug using:
  - source files
  - absolute listing file
- Transfer data dynamically via DDE (soon to be replaced by OLE)
- Run up to four emulators on the same PC

The ability to use MPLAB with Microchip's simulator allows a consistent platform and the ability to easily switch from the low cost simulator to the full featured emulator with minimal retraining due to development tools.

16.10 Assembler (MPASM)

The MPASM Universal Macro Assembler is a PC-hosted symbolic assembler. It supports all microcontroller series including the PIC12C5XX, PIC14000, PIC16C5X, PIC16CXXX, and PIC17CXX families.

MPASM offers full featured Macro capabilities, conditional assembly, and several source and listing formats. It generates various object code formats to support Microchip's development tools as well as third party programmers.

APPENDIX C: WHAT'S NEW

The structure of the document has been made consistent with other data sheets. This ensures that important topics are covered across all PIC16/17 families. Here is an overview of new features.

Added the following devices:

PIC17CR42

PIC17C42A

PIC17CR43

A 33 MHz option is now available.

APPENDIX D: WHAT'S CHANGED

To make software more portable across the different PIC16/17 families, the name of several registers and control bits have been changed. This allows control bits that have the same function, to have the same name (regardless of processor family). Care must still be taken, since they may not be at the same special function register address. The following shows the register and bit names that have been changed:

Old Name	New Name
TX8/9	TX9
RC8/9	RX9
RCD8	RX9D
TXD8	TX9D

Instruction DECFSNZ corrected to DCFSNZ

Instruction INCFSNZ corrected to INFSNZ

Enhanced discussion on PWM to include equation for determining bits of PWM resolution.

Section 13.2.2 and 13.3.2 have had the description of updating the FERR and RX9 bits enhanced.

The location of configuration bit PM2 was changed (Figure 6-1 and Figure 14-1).

Enhanced description of the operation of the INTSTA register.

Added note to discussion of interrupt operation.

Tightened electrical spec D110.

Corrected steps for setting up USART Asynchronous Reception.
