

Welcome to [E-XFL.COM](https://www.e-xfl.com)

What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "[Embedded - Microcontrollers](#)"

Details

| | |
|----------------------------|---|
| Product Status | Obsolete |
| Core Processor | PIC |
| Core Size | 8-Bit |
| Speed | 33MHz |
| Connectivity | UART/USART |
| Peripherals | POR, PWM, WDT |
| Number of I/O | 33 |
| Program Memory Size | 16KB (8K x 16) |
| Program Memory Type | OTP |
| EEPROM Size | - |
| RAM Size | 454 x 8 |
| Voltage - Supply (Vcc/Vdd) | 4.5V ~ 6V |
| Data Converters | - |
| Oscillator Type | External |
| Operating Temperature | 0°C ~ 70°C (TA) |
| Mounting Type | Surface Mount |
| Package / Case | 44-QFP |
| Supplier Device Package | 44-MQFP (10x10) |

| 17h | PIE | RBIE | TMR3IE | TMR2IE | TMR1IE | CA2IE | CA1IE | TXIE | RCIE | 0000 0000 | 0000 0000 |

Legend: x = unknown, u = unchanged, - = unimplemented read as '0', q - value depends on condition. Shaded cells are unimplemented, read as '0'.

Note 1: The upper byte of the program counter is not directly accessible. PCLATH is a holding register for PC<15:8> whose contents are updated from or transferred to the upper byte of the program counter.

2: The T0 and PD status bits in CPUSTA are not affected by a MCLR reset.

3: Other (non power-up) resets include: external reset through MCLR and the Watchdog Timer Reset.

4: The following values are for both TBLPTRL and TBLPTRH:

All PIC17C4X devices (Power-on Reset 0000 0000) and (All other resets 0000 0000)
except the PIC17C42 (Power-on Reset xxxx xxxx) and (All other resets uuuu uuuu)

5: The PRODL and PRODH registers are not implemented on the PIC17C42.

PIC17C4X

6.2.2.3 TMR0 STATUS/CONTROL REGISTER (T0STA)

This register contains various control bits. Bit7 (INTEDG) is used to control the edge upon which a signal on the RA0/INT pin will set the RB0/INT interrupt flag. The other bits configure the Timer0 prescaler and clock source. (Figure 11-1).

FIGURE 6-9: T0STA REGISTER (ADDRESS: 05h, UNBANKED)

| R/W - 0 | R/W - 0 | R/W - 0 | R/W - 0 | R/W - 0 | R/W - 0 | R/W - 0 | U - 0 |
|---------|---------|---------|---------|---------|---------|---------|-------|
| INTEDG | T0SE | T0CS | PS3 | PS2 | PS1 | PS0 | — |
| bit7 | | | | | | | bit0 |

R = Readable bit
W = Writable bit
U = Unimplemented, reads as '0'
-n = Value at POR reset

bit 7: **INTEDG:** RA0/INT Pin Interrupt Edge Select bit
This bit selects the edge upon which the interrupt is detected.
1 = Rising edge of RA0/INT pin generates interrupt
0 = Falling edge of RA0/INT pin generates interrupt

bit 6: **T0SE:** Timer0 Clock Input Edge Select bit
This bit selects the edge upon which TMR0 will increment.
When T0CS = 0
1 = Rising edge of RA1/T0CKI pin increments TMR0 and/or generates a T0CKIF interrupt
0 = Falling edge of RA1/T0CKI pin increments TMR0 and/or generates a T0CKIF interrupt
When T0CS = 1
Don't care

bit 5: **T0CS:** Timer0 Clock Source Select bit
This bit selects the clock source for Timer0.
1 = Internal instruction clock cycle (TCY)
0 = T0CKI pin

bit 4-1: **PS3:PS0:** Timer0 Prescale Selection bits
These bits select the prescale value for Timer0.

| PS3:PS0 | Prescale Value |
|---------|----------------|
| 0000 | 1:1 |
| 0001 | 1:2 |
| 0010 | 1:4 |
| 0011 | 1:8 |
| 0100 | 1:16 |
| 0101 | 1:32 |
| 0110 | 1:64 |
| 0111 | 1:128 |
| 1xxx | 1:256 |

bit 0: **Unimplemented:** Read as '0'

7.1 Table Writes to Internal Memory

A table write operation to internal memory causes a long write operation. The long write is necessary for programming the internal EPROM. Instruction execution is halted while in a long write cycle. The long write will be terminated by any enabled interrupt. To ensure that the EPROM location has been well programmed, a minimum programming time is required (see specification #D114). Having only one interrupt enabled to terminate the long write ensures that no unintentional interrupts will prematurely terminate the long write.

The sequence of events for programming an internal program memory location should be:

1. Disable all interrupt sources, except the source to terminate EPROM program write.
2. Raise $\overline{\text{MCLR}}$ /VPP pin to the programming voltage.
3. Clear the WDT.
4. Do the table write. The interrupt will terminate the long write.
5. Verify the memory location (table read).

Note: Programming requirements must be met. See timing specification in electrical specifications for the desired device. Violating these specifications (including temperature) may result in EPROM locations that are not fully programmed and may lose their state over time.

7.1.1 TERMINATING LONG WRITES

An interrupt source or reset are the only events that terminate a long write operation. Terminating the long write from an interrupt source requires that the interrupt enable and flag bits are set. The GLINTD bit only enables the vectoring to the interrupt address.

If the T0CKI, RA0/INT, or TMR0 interrupt source is used to terminate the long write; the interrupt flag, of the highest priority enabled interrupt, will terminate the long write and automatically be cleared.

Note 1: If an interrupt is pending, the TABLWT is aborted (an NOP is executed). The highest priority pending interrupt, from the T0CKI, RA0/INT, or TMR0 sources that is enabled, has its flag cleared.

Note 2: If the interrupt is not being used for the program write timing, the interrupt should be disabled. This will ensure that the interrupt is not lost, nor will it terminate the long write prematurely.

If a peripheral interrupt source is used to terminate the long write, the interrupt enable and flag bits must be set. The interrupt flag will not be automatically cleared upon the vectoring to the interrupt vector address.

If the GLINTD bit is cleared prior to the long write, when the long write is terminated, the program will branch to the interrupt vector.

If the GLINTD bit is set prior to the long write, when the long write is terminated, the program will not vector to the interrupt address.

TABLE 7-1: INTERRUPT - TABLE WRITE INTERACTION

| Interrupt Source | GLINTD | Enable Bit | Flag Bit | Action |
|----------------------|--------|------------|----------|---|
| RA0/INT, TMR0, T0CKI | 0 | 1 | 1 | Terminate long table write (to internal program memory), branch to interrupt vector (branch clears flag bit). |
| | 0 | 1 | 0 | None |
| | 1 | 0 | x | None |
| | 1 | 1 | 1 | Terminate table write, do not branch to interrupt vector (flag is automatically cleared). |
| Peripheral | 0 | 1 | 1 | Terminate table write, branch to interrupt vector. |
| | 0 | 1 | 0 | None |
| | 1 | 0 | x | None |
| | 1 | 1 | 1 | Terminate table write, do not branch to interrupt vector (flag is set). |

9.0 I/O PORTS

The PIC17C4X devices have five I/O ports, PORTA through PORTE. PORTB through PORTE have a corresponding Data Direction Register (DDR), which is used to configure the port pins as inputs or outputs. These five ports are made up of 33 I/O pins. Some of these ports pins are multiplexed with alternate functions.

PORTC, PORTD, and PORTE are multiplexed with the system bus. These pins are configured as the system bus when the device's configuration bits are selected to Microprocessor or Extended Microcontroller modes. In the two other microcontroller modes, these pins are general purpose I/O.

PORTA and PORTB are multiplexed with the peripheral features of the device. These peripheral features are:

- Timer modules
- Capture module
- PWM module
- USART/SCI module
- External Interrupt pin

When some of these peripheral modules are turned on, the port pin will automatically configure to the alternate function. The modules that do this are:

- PWM module
- USART/SCI module

When a pin is automatically configured as an output by a peripheral module, the pins data direction (DDR) bit is unknown. After disabling the peripheral module, the user should re-initialize the DDR bit to the desired configuration.

The other peripheral modules (which require an input) must have their data direction bit configured appropriately.

Note: A pin that is a peripheral input, can be configured as an output (DDRx<y> is cleared). The peripheral events will be determined by the action output on the port pin.

9.1 PORTA Register

PORTA is a 6-bit wide latch. PORTA does not have a corresponding Data Direction Register (DDR).

Reading PORTA reads the status of the pins.

The RA1 pin is multiplexed with TMR0 clock input, and RA4 and RA5 are multiplexed with the USART functions. The control of RA4 and RA5 as outputs is automatically configured by the USART module.

9.1.1 USING RA2, RA3 AS OUTPUTS

The RA2 and RA3 pins are open drain outputs. To use the RA2 or the RA3 pin(s) as output(s), simply write to the PORTA register the desired value. A '0' will cause the pin to drive low, while a '1' will cause the pin to float (hi-impedance). An external pull-up resistor should be used to pull the pin high. Writes to PORTA will not affect the other pins.

Note: When using the RA2 or RA3 pin(s) as output(s), read-modify-write instructions (such as BCF, BSF, BTG) on PORTA are not recommended. Such operations read the port pins, do the desired operation, and then write this value to the data latch. This may inadvertently cause the RA2 or RA3 pins to switch from input to output (or vice-versa). It is recommended to use a shadow register for PORTA. Do the bit operations on this shadow register and then move it to PORTA.

FIGURE 9-1: RA0 AND RA1 BLOCK DIAGRAM

FIGURE 12-2: TCON2 REGISTER (ADDRESS: 17h, BANK 3)

| R - 0 | R - 0 | R/W - 0 | R/W - 0 | R/W - 0 | R/W - 0 | R/W - 0 | R/W - 0 |
|--------|--------|---------|---------|---------|---------|---------|---------|
| CA2OVF | CA1OVF | PWM2ON | PWM1ON | CA1/PR3 | TMR3ON | TMR2ON | TMR1ON |
| bit7 | | | | | | | bit0 |

R = Readable bit
W = Writable bit
-n = Value at POR reset

bit 7: **CA2OVF**: Capture2 Overflow Status bit
 This bit indicates that the capture value had not been read from the capture register pair (CA2H:CA2L) before the next capture event occurred. The capture register retains the oldest unread capture value (last capture before overflow). Subsequent capture events will not update the capture register with the Timer3 value until the capture register has been read (both bytes).
 1 = Overflow occurred on Capture2 register
 0 = No overflow occurred on Capture2 register

bit 6: **CA1OVF**: Capture1 Overflow Status bit
 This bit indicates that the capture value had not been read from the capture register pair (PR3H/CA2H:PR3L/CA2L) before the next capture event occurred. The capture register retains the oldest unread capture value (last capture before overflow). Subsequent capture events will not update the capture register with the TMR3 value until the capture register has been read (both bytes).
 1 = Overflow occurred on Capture1 register
 0 = No overflow occurred on Capture1 register

bit 5: **PWM2ON**: PWM2 On bit
 1 = PWM2 is enabled (The RB3/PWM2 pin ignores the state of the DDRB<3> bit)
 0 = PWM2 is disabled (The RB3/PWM2 pin uses the state of the DDRB<3> bit for data direction)

bit 4: **PWM1ON**: PWM1 On bit
 1 = PWM1 is enabled (The RB2/PWM1 pin ignores the state of the DDRB<2> bit)
 0 = PWM1 is disabled (The RB2/PWM1 pin uses the state of the DDRB<2> bit for data direction)

bit 3: **CA1/PR3**: CA1/PR3 Register Mode Select bit
 1 = Enables Capture1 (PR3H/CA1H:PR3L/CA1L is the Capture1 register. Timer3 runs without a period register)
 0 = Enables the Period register (PR3H/CA1H:PR3L/CA1L is the Period register for Timer3)

bit 2: **TMR3ON**: Timer3 On bit
 1 = Starts Timer3
 0 = Stops Timer3

bit 1: **TMR2ON**: Timer2 On bit
 This bit controls the incrementing of the Timer2 register. When Timer2:Timer1 form the 16-bit timer (T16 is set), TMR2ON must be set. This allows the MSB of the timer to increment.
 1 = Starts Timer2 (Must be enabled if the T16 bit (TCON1<3>) is set)
 0 = Stops Timer2

bit 0: **TMR1ON**: Timer1 On bit
When T16 is set (in 16-bit Timer Mode)
 1 = Starts 16-bit Timer2:Timer1
 0 = Stops 16-bit Timer2:Timer1

When T16 is clear (in 8-bit Timer Mode)
 1 = Starts 8-bit Timer1
 0 = Stops 8-bit Timer1

12.1.3.3.1 MAX RESOLUTION/FREQUENCY FOR EXTERNAL CLOCK INPUT

The use of an external clock for the PWM time-base (Timer1 or Timer2) limits the PWM output to a maximum resolution of 8-bits. The PWxDCL<7:6> bits must be kept cleared. Use of any other value will distort the PWM output. All resolutions are supported when internal clock mode is selected. The maximum attainable frequency is also lower. This is a result of the timing requirements of an external clock input for a timer (see the Electrical Specification section). The maximum PWM frequency, when the timers clock source is the RB4/TCLK12 pin, is shown in Table 12-3 (standard resolution mode).

12.2 Timer3

Timer3 is a 16-bit timer consisting of the TMR3H and TMR3L registers. TMR3H is the high byte of the timer and TMR3L is the low byte. This timer has an associated 16-bit period register (PR3H/CA1H:PR3L/CA1L). This period register can be software configured to be a second 16-bit capture register.

When the TMR3CS bit (TCON1<2>) is clear, the timer increments every instruction cycle ($F_{osc}/4$). When TMR3CS is set, the timer increments on every falling edge of the RB5/TCLK3 pin. In either mode, the TMR3ON bit must be set for the timer to increment. When TMR3ON is clear, the timer will not increment or set the TMR3IF bit.

Timer3 has two modes of operation, depending on the CA1/PR3 bit (TCON2<3>). These modes are:

- One capture and one period register mode
- Dual capture register mode

The PIC17C4X has up to two 16-bit capture registers that capture the 16-bit value of TMR3 when events are detected on capture pins. There are two capture pins (RB0/CAP1 and RB1/CAP2), one for each capture register. The capture pins are multiplexed with PORTB pins. An event can be:

- a rising edge
- a falling edge
- every 4th rising edge
- every 16th rising edge

Each 16-bit capture register has an interrupt flag associated with it. The flag is set when a capture is made. The capture module is truly part of the Timer3 block. Figure 12-7 and Figure 12-8 show the block diagrams for the two modes of operation.

TABLE 12-4: REGISTERS/BITS ASSOCIATED WITH PWM

| Address | Name | Bit 7 | Bit 6 | Bit 5 | Bit 4 | Bit 3 | Bit 2 | Bit 1 | Bit 0 | Value on Power-on Reset | Value on all other resets (Note1) |

13.0 UNIVERSAL SYNCHRONOUS ASYNCHRONOUS RECEIVER TRANSMITTER (USART) MODULE

The USART module is a serial I/O module. The USART can be configured as a full duplex asynchronous system that can communicate with peripheral devices such as CRT terminals and personal computers, or it can be configured as a half duplex synchronous system that can communicate with peripheral devices such as A/D or D/A integrated circuits, Serial EEPROMs etc. The USART can be configured in the following modes:

- Asynchronous (full duplex)
- Synchronous - Master (half duplex)
- Synchronous - Slave (half duplex)

The SPEN (RCSTA<7>) bit has to be set in order to configure RA4 and RA5 as the Serial Communication Interface.

The USART module will control the direction of the RA4/RX/DT and RA5/TX/CK pins, depending on the states of the USART configuration bits in the RCSTA and TXSTA registers. The bits that control I/O direction are:

- SPEN
- TXEN
- SREN
- CREN
- CSRC

The Transmit Status And Control Register is shown in Figure 13-1, while the Receive Status And Control Register is shown in Figure 13-2.

FIGURE 13-1: TXSTA REGISTER (ADDRESS: 15h, BANK 0)

| R/W - 0 | R/W - 0 | R/W - 0 | R/W - 0 | U - 0 | U - 0 | R - 1 | R/W - x |
|---------|---------|---------|---------|-------|-------|-------|---------|

| bit7 | | | | | | | bit0 |

R = Readable bit
W = Writable bit
-n = Value at POR reset
(x = unknown)

bit 7: **CSRC**: Clock Source Select bit
Synchronous mode:
1 = Master Mode (Clock generated internally from BRG)
0 = Slave mode (Clock from external source)
Asynchronous mode:
Don't care

bit 6: **TX9**: 9-bit Transmit Enable bit
1 = Selects 9-bit transmission
0 = Selects 8-bit transmission

bit 5: **TXEN**: Transmit Enable bit
1 = Transmit enabled
0 = Transmit disabled
SREN/CREN overrides TXEN in SYNC mode

bit 4: **SYNC**: USART mode Select bit
(Synchronous/Asynchronous)
1 = Synchronous mode
0 = Asynchronous mode

bit 3-2: **Unimplemented**: Read as '0'

bit 1: **TRMT**: Transmit Shift Register (TSR) Empty bit
1 = TSR empty
0 = TSR full

bit 0: **TX9D**: 9th bit of transmit data (can be used to calculate the parity in software)

ADDLW

ADD Literal to WREG

Syntax: [*label*] ADDLW k

Operands: $0 \leq k \leq 255$

Operation: (WREG) + k → (WREG)

Status Affected: OV, C, DC, Z

Encoding:

| | | | |
|------|------|------|------|
| 1011 | 0001 | kkkk | kkkk |
|------|------|------|------|

Description: The contents of WREG are added to the 8-bit literal 'k' and the result is placed in WREG.

Words: 1

Cycles: 1

Q Cycle Activity:

| | | | |
|--------|------------------|---------|---------------|
| Q1 | Q2 | Q3 | Q4 |
| Decode | Read literal 'k' | Execute | Write to WREG |

Example: ADDLW 0x15

Before Instruction
WREG = 0x10

After Instruction
WREG = 0x25

ADDWF

ADD WREG to f

Syntax: [*label*] ADDWF f,d

Operands: $0 \leq f \leq 255$
 $d \in [0,1]$

Operation: (WREG) + (f) → (dest)

Status Affected: OV, C, DC, Z

Encoding:

| | | | |
|------|------|------|------|
| 0000 | 111d | ffff | ffff |
|------|------|------|------|

Description: Add WREG to register 'f'. If 'd' is 0 the result is stored in WREG. If 'd' is 1 the result is stored back in register 'f'.

Words: 1

Cycles: 1

Q Cycle Activity:

| | | | |
|--------|-------------------|---------|----------------------|
| Q1 | Q2 | Q3 | Q4 |
| Decode | Read register 'f' | Execute | Write to destination |

Example: ADDWF REG, 0

Before Instruction
WREG = 0x17
REG = 0xC2

After Instruction
WREG = 0xD9
REG = 0xC2

DECF Decrement f

Syntax: [*label*] DECF f,d

Operands: $0 \leq f \leq 255$
 $d \in [0,1]$

Operation: $(f) - 1 \rightarrow (\text{dest})$

Status Affected: OV, C, DC, Z

Encoding:

| | | | |
|------|------|------|------|
| 0000 | 011d | ffff | ffff |
|------|------|------|------|

Description: Decrement register 'f'. If 'd' is 0 the result is stored in WREG. If 'd' is 1 the result is stored back in register 'f'.

Words: 1

Cycles: 1

Q Cycle Activity:

| Q1 | Q2 | Q3 | Q4 |
|--------|-------------------|---------|----------------------|
| Decode | Read register 'f' | Execute | Write to destination |

Example: DECF CNT, 1

Before Instruction

CNT = 0x01
Z = 0

After Instruction

CNT = 0x00
Z = 1

DECFSZ Decrement f, skip if 0

Syntax: [*label*] DECFSZ f,d

Operands: $0 \leq f \leq 255$
 $d \in [0,1]$

Operation: $(f) - 1 \rightarrow (\text{dest})$;
skip if result = 0

Status Affected: None

Encoding:

| | | | |
|------|------|------|------|
| 0001 | 011d | ffff | ffff |
|------|------|------|------|

Description: The contents of register 'f' are decremented. If 'd' is 0 the result is placed in WREG. If 'd' is 1 the result is placed back in register 'f'.

If the result is 0, the next instruction, which is already fetched, is discarded, and an NOP is executed instead making it a two-cycle instruction.

Words: 1

Cycles: 1(2)

Q Cycle Activity:

| Q1 | Q2 | Q3 | Q4 |
|--------|-------------------|---------|----------------------|
| Decode | Read register 'f' | Execute | Write to destination |

Example: HERE DECFSZ CNT, 1
GOTO LOOP

CONTINUE

Before Instruction

PC = Address (HERE)

After Instruction

CNT = CNT - 1
If CNT = 0;
PC = Address (CONTINUE)
If CNT \neq 0;
PC = Address (HERE+1)

PIC17C4X

SUBWF Subtract WREG from f

Syntax: [label] SUBWF f,d

Operands: $0 \leq f \leq 255$
 $d \in [0,1]$

Operation: $(f) - (W) \rightarrow (\text{dest})$

Status Affected: OV, C, DC, Z

Encoding:

| | | | |
|------|------|------|------|
| 0000 | 010d | ffff | ffff |
|------|------|------|------|

Description: Subtract WREG from register 'f' (2's complement method). If 'd' is 0 the result is stored in WREG. If 'd' is 1 the result is stored back in register 'f'.

Words: 1

Cycles: 1

Q Cycle Activity:

| Q1 | Q2 | Q3 | Q4 |
|--------|-------------------|---------|----------------------|
| Decode | Read register 'f' | Execute | Write to destination |

Example 1: SUBWF REG1, 1

Before Instruction

REG1 = 3
WREG = 2
C = ?

After Instruction

REG1 = 1
WREG = 2
C = 1 ; result is positive
Z = 0

Example 2:

Before Instruction

REG1 = 2
WREG = 2
C = ?

After Instruction

REG1 = 0
WREG = 2
C = 1 ; result is zero
Z = 1

Example 3:

Before Instruction

REG1 = 1
WREG = 2
C = ?

After Instruction

REG1 = FF
WREG = 2
C = 0 ; result is negative
Z = 0

SUBWFB Subtract WREG from f with Borrow

Syntax: [label] SUBWFB f,d

Operands: $0 \leq f \leq 255$
 $d \in [0,1]$

Operation: $(f) - (W) - \overline{C} \rightarrow (\text{dest})$

Status Affected: OV, C, DC, Z

Encoding:

| | | | |
|------|------|------|------|
| 0000 | 001d | ffff | ffff |
|------|------|------|------|

Description: Subtract WREG and the carry flag (borrow) from register 'f' (2's complement method). If 'd' is 0 the result is stored in WREG. If 'd' is 1 the result is stored back in register 'f'.

Words: 1

Cycles: 1

Q Cycle Activity:

| Q1 | Q2 | Q3 | Q4 |
|--------|-------------------|---------|----------------------|
| Decode | Read register 'f' | Execute | Write to destination |

Example 1: SUBWFB REG1, 1

Before Instruction

REG1 = 0x19 (0001 1001)
WREG = 0x0D (0000 1101)
C = 1

After Instruction

REG1 = 0x0C (0000 1011)
WREG = 0x0D (0000 1101)
C = 1 ; result is positive
Z = 0

Example2: SUBWFB REG1,0

Before Instruction

REG1 = 0x1B (0001 1011)
WREG = 0x1A (0001 1010)
C = 0

After Instruction

REG1 = 0x1B (0001 1011)
WREG = 0x00
C = 1 ; result is zero
Z = 1

Example3: SUBWFB REG1,1

Before Instruction

REG1 = 0x03 (0000 0011)
WREG = 0x0E (0000 1101)
C = 1

After Instruction

REG1 = 0xF5 (1111 0100) [2's comp]
WREG = 0x0E (0000 1101)
C = 0 ; result is negative
Z = 0

16.6 PICDEM-1 Low-Cost PIC16/17 Demonstration Board

The PICDEM-1 is a simple board which demonstrates the capabilities of several of Microchip's microcontrollers. The microcontrollers supported are: PIC16C5X (PIC16C54 to PIC16C58A), PIC16C61, PIC16C62X, PIC16C71, PIC16C8X, PIC17C42, PIC17C43 and PIC17C44. All necessary hardware and software is included to run basic demo programs. The users can program the sample microcontrollers provided with the PICDEM-1 board, on a PRO MATE II or PICSTART-16B programmer, and easily test firmware. The user can also connect the PICDEM-1 board to the PICMASTER emulator and download the firmware to the emulator for testing. Additional prototype area is available for the user to build some additional hardware and connect it to the microcontroller socket(s). Some of the features include an RS-232 interface, a potentiometer for simulated analog input, push-button switches and eight LEDs connected to PORTB.

16.7 PICDEM-2 Low-Cost PIC16CXX Demonstration Board

The PICDEM-2 is a simple demonstration board that supports the PIC16C62, PIC16C64, PIC16C65, PIC16C73 and PIC16C74 microcontrollers. All the necessary hardware and software is included to run the basic demonstration programs. The user can program the sample microcontrollers provided with the PICDEM-2 board, on a PRO MATE II programmer or PICSTART-16C, and easily test firmware. The PICMASTER emulator may also be used with the PICDEM-2 board to test firmware. Additional prototype area has been provided to the user for adding additional hardware and connecting it to the microcontroller socket(s). Some of the features include a RS-232 interface, push-button switches, a potentiometer for simulated analog input, a Serial EEPROM to demonstrate usage of the I²C bus and separate headers for connection to an LCD module and a keypad.

16.8 PICDEM-3 Low-Cost PIC16CXXX Demonstration Board

The PICDEM-3 is a simple demonstration board that supports the PIC16C923 and PIC16C924 in the PLCC package. It will also support future 44-pin PLCC microcontrollers with a LCD Module. All the necessary hardware and software is included to run the basic demonstration programs. The user can program the sample microcontrollers provided with the PICDEM-3 board, on a PRO MATE II programmer or PICSTART Plus with an adapter socket, and easily test firmware. The PICMASTER emulator may also be used with the PICDEM-3 board to test firmware. Additional prototype area has been provided to the user for adding hardware and connecting it to the microcontroller socket(s). Some of the features

include an RS-232 interface, push-button switches, a potentiometer for simulated analog input, a thermistor and separate headers for connection to an external LCD module and a keypad. Also provided on the PICDEM-3 board is an LCD panel, with 4 commons and 12 segments, that is capable of displaying time, temperature and day of the week. The PICDEM-3 provides an additional RS-232 interface and Windows 3.1 software for showing the demultiplexed LCD signals on a PC. A simple serial interface allows the user to construct a hardware demultiplexer for the LCD signals. PICDEM-3 will be available in the 3rd quarter of 1996.

16.9 MPLAB Integrated Development Environment Software

The MPLAB IDE Software brings an ease of software development previously unseen in the 8-bit microcontroller market. MPLAB is a windows based application which contains:

- A full featured editor
- Three operating modes
 - editor
 - emulator
 - simulator
- A project manager
- Customizable tool bar and key mapping
- A status bar with project information
- Extensive on-line help

MPLAB allows you to:

- Edit your source files (either assembly or 'C')
- One touch assemble (or compile) and download to PIC16/17 tools (automatically updates all project information)
- Debug using:
 - source files
 - absolute listing file
- Transfer data dynamically via DDE (soon to be replaced by OLE)
- Run up to four emulators on the same PC

The ability to use MPLAB with Microchip's simulator allows a consistent platform and the ability to easily switch from the low cost simulator to the full featured emulator with minimal retraining due to development tools.

16.10 Assembler (MPASM)

The MPASM Universal Macro Assembler is a PC-hosted symbolic assembler. It supports all microcontroller series including the PIC12C5XX, PIC14000, PIC16C5X, PIC16CXXX, and PIC17CXX families.

MPASM offers full featured Macro capabilities, conditional assembly, and several source and listing formats. It generates various object code formats to support Microchip's development tools as well as third party programmers.

17.2 DC CHARACTERISTICS: PIC17C42-16 (Commercial, Industrial) PIC17C42-25 (Commercial, Industrial)

| Standard Operating Conditions (unless otherwise stated) | | | | | | | |
|--|-------|--------------------------------------|----------|--------|--------|-------|--|
| Operating temperature | | | | | | | |
| DC CHARACTERISTICS | | | | | | | |
| Operating voltage VDD range as described in Section 17.1 | | | | | | | |
| Parameter No. | Sym | Characteristic | Min | Typ† | Max | Units | Conditions |
| D030 | VIL | Input Low Voltage | | | | | |
| | | I/O ports | | | | | |
| D031 | | with TTL buffer | VSS | – | 0.8 | V | |
| D032 | | with Schmitt Trigger buffer | VSS | – | 0.2VDD | V | |
| D032 | | MCLR, OSC1 (in EC and RC mode) | VSS | – | 0.2VDD | V | Note1 |
| D033 | | OSC1 (in XT, and LF mode) | – | 0.5VDD | – | V | |
| | VIH | Input High Voltage | | | | | |
| | | I/O ports | | – | | | |
| D040 | | with TTL buffer | 2.0 | – | VDD | V | |
| D041 | | with Schmitt Trigger buffer | 0.8VDD | – | VDD | V | |
| D042 | | MCLR | 0.8VDD | – | VDD | V | Note1 |
| D043 | | OSC1 (XT, and LF mode) | – | 0.5VDD | – | V | |
| D050 | VHYS | Hysteresis of Schmitt Trigger inputs | 0.15VDD* | – | – | V | |
| | IIL | Input Leakage Current | | | | | |
| | | (Notes 2, 3) | | | | | |
| D060 | | I/O ports (except RA2, RA3) | – | – | ±1 | µA | VSS ≤ VPIN ≤ VDD, I/O Pin at hi-impedance PORTB weak pull-ups disabled |
| D061 | | MCLR | – | – | ±2 | µA | VPIN = VSS or VPIN = VDD |
| D062 | | RA2, RA3 | – | – | ±2 | µA | VSS ≤ VRA2, VRA3 ≤ 12V |
| D063 | | OSC1, TEST | – | – | ±1 | µA | VSS ≤ VPIN ≤ VDD |
| D064 | | MCLR | – | – | 10 | µA | VMCLR = VPP = 12V (when not programming) |
| D070 | IPURB | PORTB weak pull-up current | 60 | 200 | 400 | µA | VPIN = VSS, RBPU = 0 |

* These parameters are characterized but not tested.

† Data in "Typ" column is at 5V, 25°C unless otherwise stated. These parameters are for design guidance only and are not tested.

‡ These parameters are for design guidance only and are not tested, nor characterized.

†† Design guidance to attain the AC timing specifications. These loads are not tested.

Note 1: In RC oscillator configuration, the OSC1 pin is a Schmitt Trigger input. It is not recommended that the PIC17CXX devices be driven with external clock in RC mode.

2: The leakage current on the MCLR pin is strongly dependent on the applied voltage level. The specified levels represent normal operating conditions. Higher leakage current may be measured at different input voltages.

3: Negative current is defined as coming out of the pin.

4: These specifications are for the programming of the on-chip program memory EPROM through the use of the table write instructions. The complete programming specifications can be found in: PIC17CXX Programming Specifications (Literature number DS30139).

5: The MCLR/Vpp pin may be kept in this range at times other than programming, but this is not recommended.

6: For TTL buffers, the better of the two specifications may be used.

Sales and Support

Products supported by a preliminary Data Sheet may possibly have an errata sheet describing minor operational differences and recommended workarounds. To determine if an errata sheet exists for a particular device, please contact one of the following:

1. Your local Microchip sales office (see below)
2. The Microchip Corporate Literature Center U.S. FAX: (602) 786-7277
3. The Microchip's Bulletin Board, via your local CompuServe number (CompuServe membership NOT required).

Please specify which device, revision of silicon and Data Sheet (include Literature #) you are using.

For latest version information and upgrade kits for Microchip Development Tools, please call 1-800-755-2345 or 1-602-786-7302.
