
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	80C51
Core Size	8-Bit
Speed	60MHz
Connectivity	SPI, UART/USART
Peripherals	POR, PWM, WDT
Number of I/O	32
Program Memory Size	32KB (32K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	1.25K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 5.5V
Data Converters	-
Oscillator Type	External
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Through Hole
Package / Case	40-DIP (0.600", 15.24mm)
Supplier Device Package	40-PDIL
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/at89c51rc2-3csum

The AT89C51RB2/RC2 retains all features of the 80C52 with 256 Bytes of internal RAM, a 9-source 4-level interrupt controller and three timer/counters.

In addition, the AT89C51RB2/RC2 has a Programmable Counter Array, an XRAM of 1024 Bytes, a Hardware Watchdog Timer, a Keyboard Interface, an SPI Interface, a more versatile serial channel that facilitates multiprocessor communication (EUART) and a speed improvement mechanism (X2 mode).

The Pinout is the standard 40/44 pins of the C52.

The fully static design reduces system power consumption of the AT89C51RB2/RC2 by allowing it to bring the clock frequency down to any value, even DC, without loss of data.

The AT89C51RB2/RC2 has 2 software-selectable modes of reduced activity and 8-bit clock prescaler for further reduction in power consumption. In Idle mode, the CPU is frozen while the peripherals and the interrupt system are still operating. In power-down mode, the RAM is saved and all other functions are inoperative.

The added features of the AT89C51RB2/RC2 make it more powerful for applications that need pulse width modulation, high speed I/O and counting capabilities such as alarms, motor control, corded phones, and smart card readers.

Table 1. Memory Size

Part Number	Flash (Bytes)	XRAM (Bytes)	TOTAL RAM (Bytes)	I/O
AT89C51RB2	16K	1024	1280	32
AT89C51RC2	32K	1024	1280	32
AT89C51IC2	32K	1024	1280	32

SFR Mapping

The Special Function Registers (SFRs) of the AT89C51RB2/RC2 fall into the following categories:

- C51 core registers: ACC, B, DPH, DPL, PSW, SP
- I/O port registers: P0, P1, P2, P3
- Timer registers: T2CON, T2MOD, TCON, TH0, TH1, TH2, TMOD, TL0, TL1, TL2, RCAP2L, RCAP2H
- Serial I/O port registers: SADDR, SADEN, SBUF, SCON
- PCA (Programmable Counter Array) registers: CCON, CCAPMx, CL, CH, CCAPxH, CCAPxL (x: 0 to 4)
- Power and clock control registers: PCON
- Hardware Watchdog Timer registers: WDTRST, WDTPRG
- Interrupt system registers: IEN0, IPL0, IPH0, IEN1, IPL1, IPH1
- Keyboard Interface registers: KBE, KBF, KBLS
- SPI registers: SPCON, SPSTR, SPDAT
- BRG (Baud Rate Generator) registers: BRL, BDRCON
- Flash register: FCON
- Clock Prescaler register: CKRL
- Others: AUXR, AUXR1, CKCON0, CKCON1

Table 6. Timer SFRs

Mnemonic	Add	Name	7	6	5	4	3	2	1	0

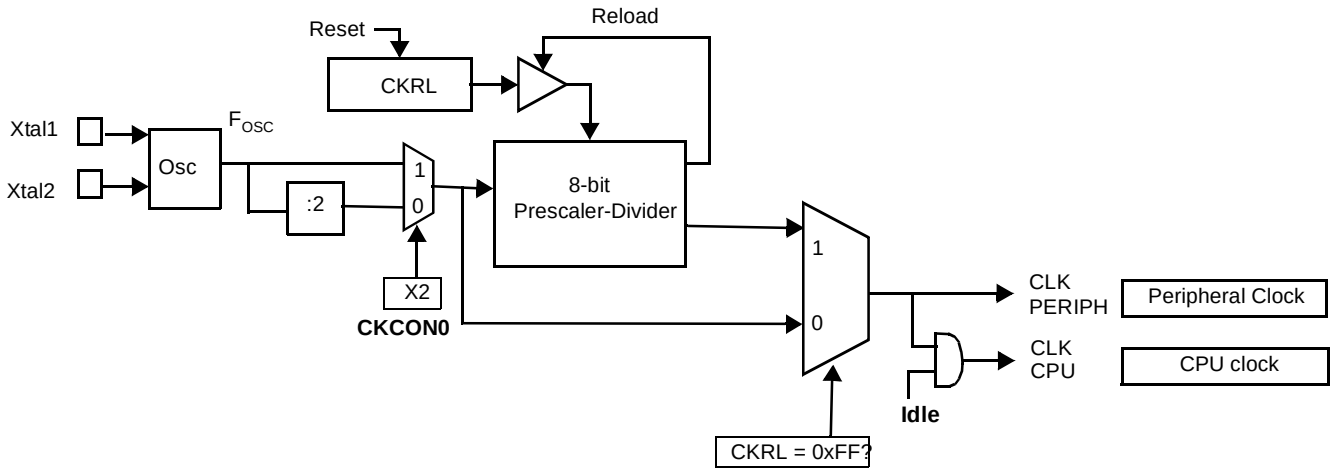
Functional Block Diagram

Figure 4. Functional Oscillator Block Diagram



Prescaler Divider

- A hardware RESET puts the prescaler divider in the following state:
  - CKRL = FFh: $F_{CLK\ CPU} = F_{CLK\ PERIPH} = F_{OSC}/2$ (Standard C51 feature)
- Any value between FFh down to 00h can be written by software into CKRL register in order to divide frequency of the selected oscillator:
  - CKRL = 00h: minimum frequency
    $F_{CLK\ CPU} = F_{CLK\ PERIPH} = F_{OSC}/1020$ (Standard Mode)
    $F_{CLK\ CPU} = F_{CLK\ PERIPH} = F_{OSC}/510$ (X2 Mode)
  - CKRL = FFh: maximum frequency
    $F_{CLK\ CPU} = F_{CLK\ PERIPH} = F_{OSC}/2$ (Standard Mode)
    $F_{CLK\ CPU} = F_{CLK\ PERIPH} = F_{OSC}$ (X2 Mode)

$F_{CLK\ CPU}$ and $F_{CLK\ PERIPH}$

In X2 Mode, for CKRL<>0xFF:

$$F_{CPU} = F_{CLKPERIPH} = \frac{F_{OSC}}{2 \times (255 - CKRL)}$$

In X1 Mode, for CKRL<>0xFF then:

$$F_{CPU} = F_{CLKPERIPH} = \frac{F_{OSC}}{4 \times (255 - CKRL)}$$

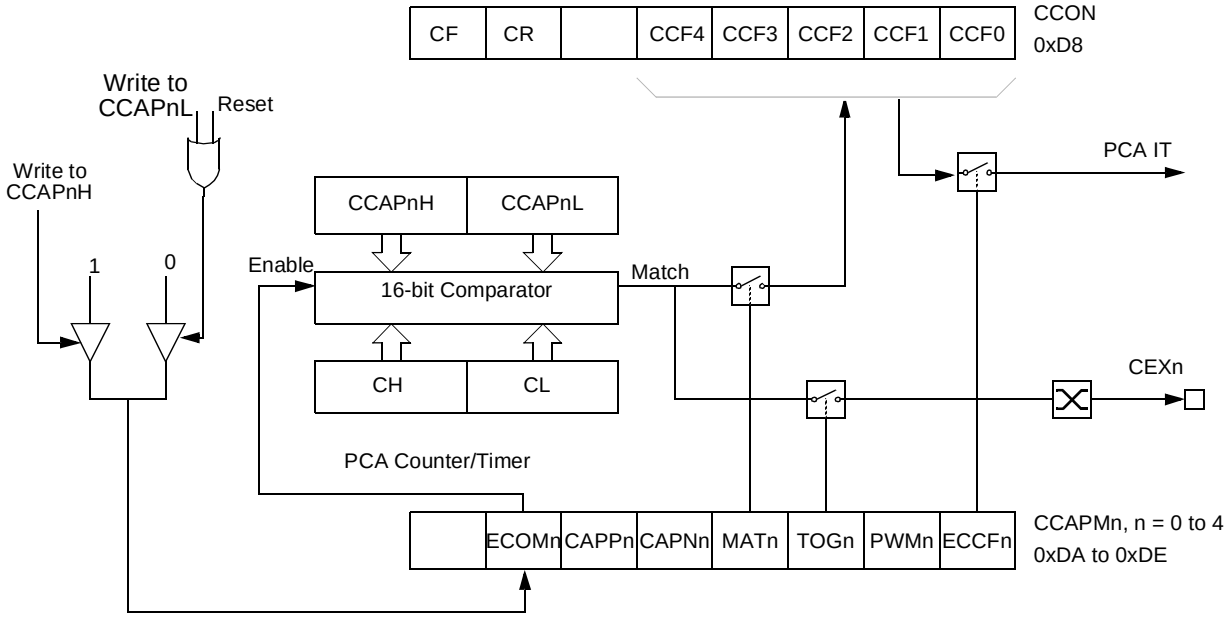
High-speed Output Mode

In this mode the CEX output (on port 1) associated with the PCA module will toggle each time a match occurs between the PCA counter and the modules capture registers. To activate this mode the TOG, MAT, and ECOM bits in the modules CCAPMn SFR must be set (see Figure 15).

A prior write must be done to CCAPnL and CCAPnH before writing the ECOMn bit.

Figure 15. PCA High-speed Output Mode



Before enabling ECOM bit, CCAPnL and CCAPnH should be set with a non-zero value, otherwise an unwanted match could occur.

Once ECOM is set, writing CCAPnL will clear ECOM so that an unwanted match doesn't occur while modifying the compare value. Writing to CCAPnH will set ECOM. For this reason, user software should write CCAPnL first, and then CCAPnH. Of course, the ECOM bit can still be controlled by accessing to CCAPMn register.

A low-priority interrupt can be interrupted by a high-priority interrupt, but not by another low-priority interrupt. A high-priority interrupt can't be interrupted by any other interrupt source.

Table 43. Priority Level Bit Values

IPH. x	IPL. x	Interrupt Level Priority
0	0	0 (Lowest)
0	1	1
1	0	2
1	1	3 (Highest)

If two interrupt requests of different priority levels are received simultaneously, the request of higher-priority level is serviced. If interrupt requests of the same priority level are received simultaneously, an internal polling sequence determines which request is serviced. Thus within each priority level there is a second priority structure determined by the polling sequence.

Table 44. IENO Register

IEN0 - Interrupt Enable Register (A8h)

7	6	5	4	3	2	1	0
EA	EC	ET2	ES	ET1	EX1	ET0	EX0

Registers

Table 51. KBF Register

KBF - Keyboard Flag Register (9Eh)

7	6	5	4	3	2	1	0
KBF7	KBF6	KBF5	KBF4	KBF3	KBF2	KBF1	KBF0

Bit Number	Bit Mnemonic	Description
7	KBF7	**Keyboard Line 7 Flag** Set by hardware when the Port line 7 detects a programmed level. It generates a Keyboard interrupt request if the KBKBIE. 7 bit in KBIE register is set. Must be cleared by software.
6	KBF6	**Keyboard Line 6 Flag** Set by hardware when the Port line 6 detects a programmed level. It generates a Keyboard interrupt request if the KBIE. 6 bit in KBIE register is set. Must be cleared by software.
5	KBF5	**Keyboard Line 5 Flag** Set by hardware when the Port line 5 detects a programmed level. It generates a Keyboard interrupt request if the KBIE. 5 bit in KBIE register is set. Must be cleared by software.
4	KBF4	**Keyboard Line 4 Flag** Set by hardware when the Port line 4 detects a programmed level. It generates a Keyboard interrupt request if the KBIE. 4 bit in KBIE register is set. Must be cleared by software.
3	KBF3	**Keyboard Line 3 Flag** Set by hardware when the Port line 3 detects a programmed level. It generates a Keyboard interrupt request if the KBIE. 3 bit in KBIE register is set. Must be cleared by software.
2	KBF2	**Keyboard Line 2 Flag** Set by hardware when the Port line 2 detects a programmed level. It generates a Keyboard interrupt request if the KBIE. 2 bit in KBIE register is set. Must be cleared by software.
1	KBF1	**Keyboard Line 1 Flag** Set by hardware when the Port line 1 detects a programmed level. It generates a Keyboard interrupt request if the KBIE. 1 bit in KBIE register is set. Must be cleared by software.
0	KBF0	**Keyboard Line 0 Flag** Set by hardware when the Port line 0 detects a programmed level. It generates a Keyboard interrupt request if the KBIE. 0 bit in KBIE register is set. Must be cleared by software.

Reset Value = 0000 0000b

This register is read only access, all flags are automatically cleared by reading the register.

drive the network. The Master may select each Slave device by software through port pins (Figure 26). To prevent bus conflicts on the MISO line, only one slave should be selected at a time by the Master for a transmission.

In a Master configuration, the $\overline{SS}$ line can be used in conjunction with the MODF flag in the SPI Status register (SPSTA) to prevent multiple masters from driving MOSI and SCK (see Error conditions).

A high level on the $\overline{SS}$ pin puts the MISO line of a Slave SPI in a high-impedance state.

The $\overline{SS}$ pin could be used as a general-purpose if the following conditions are met:

- The device is configured as a Master and the SSDIS control bit in SPCON is set. This kind of configuration can be found when only one Master is driving the network and there is no way that the $\overline{SS}$ pin could be pulled low. Therefore, the MODF flag in the SPSTA will never be set(1).
- The Device is configured as a Slave with CPHA and SSDIS control bits set(2). This kind of configuration can happen when the system comprises one Master and one Slave only. Therefore, the device should always be selected and there is no reason that the Master uses the $\overline{SS}$ pin to select the communicating Slave device.

Note: 1. Clearing SSDIS control bit does not clear MODF.

2. Special care should be taken not to set SSDIS control bit when CPHA = '0' because in this mode, the $\overline{SS}$ is used to start the transmission.

Baud Rate

In Master mode, the baud rate can be selected from a baud rate generator which is controlled by three bits in the SPCON register: SPR2, SPR1 and SPR0.The Master clock is selected from one of seven clock rates resulting from the division of the internal clock by 2, 4, 8, 16, 32, 64 or 128.

Table 54 gives the different clock rates selected by SPR2:SPR1:SPR0.

Table 54. SPI Master Baud Rate Selection

SPR2	SPR1	SPR0	Clock Rate	Baud Rate Divisor (BD)
0	0	0	$F_{CLK\ PERIPH}$ /2	2
0	0	1	$F_{CLK\ PERIPH}$ /4	4
0	1	0	$F_{CLK\ PERIPH}$/8	8
0	1	1	$F_{CLK\ PERIPH}$ /16	16
1	0	0	$F_{CLK\ PERIPH}$ /32	32
1	0	1	$F_{CLK\ PERIPH}$ /64	64
1	1	0	$F_{CLK\ PERIPH}$ /128	128
1	1	1	Don't Use	No BRG

Power-off Flag

The Power-off flag allows the user to distinguish between a “cold start” reset and a “warm start” reset.

A cold start reset is the one induced by V_{CC} switch-on. A warm start reset occurs while V_{CC} is still applied to the device and could be generated by an exit from Power-down.

The Power-off flag (POF) is located in PCON register (Table 63). POF is set by hardware when V_{CC} rises from 0 to its nominal voltage. The POF can be set or cleared by software allowing the user to determine the type of reset.

Table 63. PCON Register

PCON - Power Control Register (87h)

7	6	5	4	3	2	1	0
SMOD1	**SMOD0**	**-**	**POF**	**GF1**	**GF0**	**PD**	**IDL**

Bit Number	Bit Mnemonic	Description
7	SMOD1	**Serial port Mode Bit 1** Set to select double baud rate in mode 1, 2 or 3.
6	SMOD0	**Serial port Mode Bit 0** Cleared to select SM0 bit in SCON register. Set to select FE bit in SCON register.
5	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
4	POF	**Power-off Flag** Cleared to recognize next reset type. Set by hardware when V_{CC} rises from 0 to its nominal voltage. Can also be set by software.
3	GF1	**General-purpose Flag** Cleared by user for general-purpose usage. Set by user for general-purpose usage.
2	GF0	**General-purpose Flag** Cleared by user for general-purpose usage. Set by user for general-purpose usage.
1	PD	**Power-down mode bit** Cleared by hardware when reset occurs. Set to enter power-down mode.
0	IDL	**Idle Mode Bit** Cleared by hardware when interrupt or reset occurs. Set to enter idle mode.

Reset Value = 00X1 0000b
Not bit addressable

Reduced EMI Mode

The ALE signal is used to demultiplex address and data buses on port 0 when used with external program or data memory. Nevertheless, during internal code execution, ALE signal is still generated. In order to reduce EMI, ALE signal can be disabled by setting AO bit.

The AO bit is located in AUXR register at bit location 0.As soon as AO is set, ALE is no longer output but remains active during MOVX and MOVC instructions and external fetches. During ALE disabling, ALE pin is weakly pulled high.

Table 64. AUXR Register

AUXR - Auxiliary Register (8Eh)

7	6	5	4	3	2	1	0
DPU	**-**	**M0**	**-**	**XRS1**	**XRS0**	**EXTRAM**	**AO**

Bit Number	Bit Mnemonic	Description
7	DPU	**Disable Weak Pull-up** Cleared to activate the permanent weak pull up when latch data is logic 1 Set to disactive the weak pull-up.
6	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
5	M0	**Pulse Length** Cleared to stretch MOVX control: the $\overline{RD}$ and the $\overline{WR}$ pulse length is 6 clock periods (default). Set to stretch MOVX control: the $\overline{RD}$ and the $\overline{WR}$ pulse length is 30 clock periods.
4	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
3	XRS1	**XRAM Size** XRS1 XRS0 XRAM size 0 0 256 Bytes (default) 0 1 512 Bytes 1 0 768 Bytes 1 1 1024 Bytes
2	XRS0	
1	EXTRAM	**EXTRAM Bit** Cleared to access internal XRAM using movx @ $\overline{Ri}$ @ DPTR. Set to access external memory. Programmed by hardware after Power-up regarding Hardware Security Byte (HSB), default setting, XRAM selected.
0	AO	**ALE Output Bit** Cleared, ALE is emitted at a constant rate of 1/6 the oscillator frequency (or 1/3 if X2 mode is used). (default) Set, ALE is active only during a MOVX or MOVC instruction is used.

Functional Description

Software Security Bits (SSB)

The SSB protects any Flash access from ISP command.
The command "Program Software Security bit" can only write a higher priority level.

There are three levels of security:

- level 0: ***NO_SECURITY*** (FFh)

This is the default level.
From level 0, one can write level 1 or level 2.

- level 1: ***WRITE_SECURITY*** (FEh)

For this level it is impossible to write in the Flash memory, BSB and SBV.
The Bootloader returns 'P' on write access.
From level 1, one can write only level 2.

- level 2: ***RD_WR_SECURITY*** (FCh

The level 2 forbids all read and write accesses to/from the Flash/EEPROM memory.
The Bootloader returns 'L' on read or write access.
Only a full chip erase in parallel mode (using a programmer) or ISP command can reset the software security bits.
From level 2, one cannot read and write anything.

Table 71. Software Security Byte Behavior

	Level 0	Level 1	Level 2
Flash/EEPROM	Any access allowed	Read only access allowed	Any access not allowed
Fuse Bit	Any access allowed	Read only access allowed	Any access not allowed
BSB & SBV	Any access allowed	Read only access allowed	Any access not allowed
SSB	Any access allowed	Write level 2 allowed	Read only access allowed
Manufacturer Info	Read only access allowed	Read only access allowed	Read only access allowed
Bootloader Info	Read only access allowed	Read only access allowed	Read only access allowed
Erase Block	Allowed	Not allowed	Not allowed
Full-chip Erase	Allowed	Allowed	Allowed
Blank Check	Allowed	Allowed	Allowed

Full Chip Erase

The ISP command "Full Chip Erase" erases all User Flash memory (fills with FFh) and sets some Bytes used by the bootloader at their default values:

- BSB = FFh
- SBV = FCh
- SSB = FFh and finally erase the Software Security Bits

The Full Chip Erase does not affect the bootloader.

Checksum Error

When a checksum error is detected send ‘X’ followed with CR&LF.

Flow Description

Overview

An initialization step must be performed after each Reset. After microcontroller reset, the bootloader waits for an autobaud sequence (see section ‘autobaud performance’).

When the communication is initialized the protocol depends on the record type requested by the host.

FLIP, a software utility to implement ISP programming with a PC, is available from the Atmel the web site.

Communication Initialization

The host initializes the communication by sending a ’U’ character to help the bootloader to compute the baudrate (autobaud).
