Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	451
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	72
Number of Gates	2500
Voltage - Supply	4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	84-LCC (J-Lead)
Supplier Device Package	84-PLCC (29.31x29.31)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/a1225a-plg84c

Ordering Information

A1280 A – 1 PG G 176 C

- Application (T emperature Range)
  - C = Commercial (0 to +70°C)
  - I = Industrial (–40 to +85°C)
  - M = Military (–55 to +125°C)
  - B = MIL-STD-883
- Package Lead Count
- Lead-Free Packaging
  - Blank = Standard Packaging
  - G = RoHS Compliant Packaging
- Package Type
  - PL = Plastic J-Leaded Chip Carrier
  - PQ = Plastic Quad Flat Pack
  - CQ = Ceramic Quad Flat Pack
  - PG = Ceramic Pin Grid Array
  - TQ = Thin (1.4 mm) Quad Flat Pack
  - VQ = Very Thin (1.0 mm) Quad Flat Pack
- Speed Grade
  - Blank = Standard Speed
  - –1 = Approximately 15% faster than Standard
  - –2 = Approximately 25% faster than Standard
- Die Revision
  - A = 1.0 µm CMOS Process
- Part Number
  - A1225 = 2,500 Gates
  - A1240 = 4,000 Gates
  - A1280 = 8,000 Gates

Product Plan

Device/Package	Speed Grade[1]			Application[1]

Table 2-3 • Electrical Specifications

Symbol	Parameter	Commercial		Industrial		Military		Units
		Min.	Max.	Min.	Max.	Min.	Max.	
VOH[1]	(IOH = –10 mA)[2]	2.4	–	–	–	–	–	V
	(IOH = –6 mA)	3.84	–	–	–	–	–	V
	(IOH = –4 mA)	–	–	3.7	–	3.7	–	V
VOL[1]	(IOL = 10 mA)[2]	–	0.5	–	–	–	–	V
	(IOL = 6 mA)	–	0.33	–	0.40	–	0.40	V
VIL		–0.3	0.8	–0.3	0.8	–0.3	0.8	V
VIH		2.0	VCC + 0.3	2.0	VCC + 0.3	2.0	VCC + 0.3	V
Input Transition Time t_R, t_F[2]		–	500	–	500	–	500	ns
C_{IO} I/O capacitance[2,3]		–	10	–	10	–	10	pF
Standby Current, ICC[4] (typical = 1 mA)		–	2	–	10	–	20	mA
Leakage Current[5]		–10	+10	–10	+10	–10	+10	µA
ICC(D)	Dynamic VCC supply current. See the Power Dissipation section.							

Notes:

1. *Only one output tested at a time. VCC = minimum.*
2. *Not tested, for information only.*
3. *Includes worst-case PG176 package capacitance. VOUT = 0 V, f = 1 MHz*
4. *All outputs unloaded. All inputs = VCC or GND, typical ICC = 1 mA. ICC limit includes IPP and ISV during normal operations.*
5. *VOUT, VIN = VCC or GND.*

To calculate the active power dissipated from the complete design, the switching frequency of each part of the logic must be known. EQ 4 shows a piece-wise linear summation over all components.

$$\begin{aligned}\text{Power} =\,& VCC^2 * [(m * C_{EQM} * f_m)_{modules} + (n * C_{EQI} * f_n)_{inputs} \\ &+ (p * (C_{EQO} + C_L) * fp)_{outputs} \\ &+ 0.5 * (q1 * C_{EQCR} * f_{q1})_{routed\_Clk1} + (r1 * f_{q1})_{routed\_Clk1} \\ &+ 0.5 * (q2 * C_{EQCR} * f_{q2})_{routed\_Clk2} + (r_2 * f_{q2})_{routed\_Clk2}\end{aligned} \tag{EQ 4}$$

Where:

m = Number of logic modules switching at f_m

n = Number of input buffers switching at f_n

p = Number of output buffers switching at f_p

$q1$ = Number of clock loads on the first routed array clock

$q2$ = Number of clock loads on the second routed array clock

r_1 = Fixed capacitance due to first routed array clock

r_2 = Fixed capacitance due to second routed array clock

C_{EQM} = Equivalent capacitance of logic modules in pF

C_{EQI} = Equivalent capacitance of input buffers in pF

C_{EQO} = Equivalent capacitance of output buffers in pF

C_{EQCR} = Equivalent capacitance of routed array clock in pF

C_L = Output lead capacitance in pF

f_m = Average logic module switching rate in MHz

f_n = Average input buffer switching rate in MHz

f_p = Average output buffer switching rate in MHz

f_{q1} = Average first routed array clock rate in MHz

f_{q2} = Average second routed array clock rate in MHz

Table 2-7 • **Fixed Capacitance Values for Microsemi FPGAs**

Device Type	r1, routed_Clk1	r2, routed_Clk2
A1225A	106	106.0
A1240A	134	134.2
A1280A	168	167.8

Determining Average Switching Frequency

To determine the switching frequency for a design, you must have a detailed understanding of the data input values to the circuit. The following guidelines are meant to represent worst-case scenarios so that they can be generally used to predict the upper limits of power dissipation. These guidelines are given in Table 2-8.

Table 2-8 **• Guidelines for Predicting Power Dissipation**

Data	Value
Logic Modules (m)	80% of modules
Inputs switching (n)	# inputs/4
Outputs switching (p)	# output/4
First routed array clock loads (q1)	40% of sequential modules
Second routed array clock loads (q2)	40% of sequential modules
Load capacitance (C_L)	35 pF
Average logic module switching rate (f_m)	F/10
Average input switching rate (f_n)	F/5
Average output switching rate (f_p)	F/10
Average first routed array clock rate (f_{q1})	F
Average second routed array clock rate (f_{q2})	F/2

A1225A Timing Characteristics

***Table 2-12* • A1225A Worst-Case Commercial Conditions, VCC = 4.75 V, T_J = 70°C**

Logic Module Propagation Delays[1]		–2 Speed[3]		–1 Speed		Std. Speed		Units
Parameter/Description		**Min.**	**Max.**	**Min.**	**Max.**	**Min.**	**Max.**	
t_{PD1}	Single Module		3.8		4.3		5.0	ns
t_{CO}	Sequential Clock to Q		3.8		4.3		5.0	ns
t_{GO}	Latch G to Q		3.8		4.3		5.0	ns
t_{RS}	Flip-Flop (Latch) Reset to Q		3.8		4.3		5.0	ns
Predicted Routing Delays[2]								
t_{RD1}	FO = 1 Routing Delay		1.1		1.2		1.4	ns
t_{RD2}	FO = 2 Routing Delay		1.7		1.9		2.2	ns
t_{RD3}	FO = 3 Routing Delay		2.3		2.6		3.0	ns
t_{RD4}	FO = 4 Routing Delay		2.8		3.1		3.7	ns
t_{RD8}	FO = 8 Routing Delay		4.4		4.9		5.8	ns
Sequential Timing Characteristics[3,4]								
t_{SUD}	Flip-Flop (Latch) Data Input Setup	0.4		0.4		0.5		ns
t_{HD}	Flip-Flop (Latch) Data Input Hold	0.0		0.0		0.0		ns
t_{SUENA}	Flip-Flop (Latch) Enable Setup	0.8		0.9		1.0		ns
t_{HENA}	Flip-Flop (Latch) Enable Hold	0.0		0.0		0.0		ns
t_{WCLKA}	Flip-Flop (Latch) Clock Active Pulse Width	4.5		5.0		6.0		ns
t_{WASYN}	Flip-Flop (Latch) Clock Asynchronous Pulse Width	4.5		5.0		6.0		ns
t_A	Flip-Flop Clock Input Period	9.4		11.0		13.0		ns
t_{INH}	Input Buffer Latch Hold	0.0		0.0		0.0		ns
t_{INSU}	Input Buffer Latch Setup	0.4		0.4		0.5		ns
t_{OUTH}	Output Buffer Latch Hold	0.0		0.0		0.0		ns
t_{OUTSU}	Output Buffer Latch Setup	0.4		0.4		0.5		ns
f_{MAX}	Flip-Flop (Latch) Clock Frequency		105.0		90.0		75.0	MHz

Notes:

1. *For dual-module macros, use $t_{PD1} + t_{RD1} + t_{PDn}$, $t_{CO} + t_{RD1} + t_{PDn}$, or $t_{PD1} + t_{RD1} + t_{SUD}$—whichever is appropriate.*
2. *Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual worst-case performance. Post-route timing is based on actual routing delay measurements performed on the device prior to shipment.*
3. *Data applies to macros based on the S-module. Timing parameters for sequential macros constructed from C-modules can be obtained from the DirectTime Analyzer utility.*
4. *Setup and hold timing parameters for the Input Buffer Latch are defined with respect to the PAD and the D input. External setup/hold timing parameters must account for delay from an external PAD signal to the G inputs. Delay from an external PAD signal to the G input subtracts (adds) to the internal setup (hold) time.*

Post-route timing is based on actual routing delay measurements performed on the device prior to shipment.*

A1280A Timing Characteristics (continued)

Pin Descriptions

CLKA Clock A (Input)

TTL Clock input for clock distribution networks. The Clock input is buffered prior to clocking the logic modules. This pin can also be used as an I/O.

CLKB Clock B (Input)

TTL Clock input for clock distribution networks. The Clock input is buffered prior to clocking the logic modules. This pin can also be used as an I/O.

DCLK Diagnostic Clock (Input)

TTL Clock input for diagnostic probe and device programming. DCLK is active when the MODE pin is High. This pin functions as an I/O when the MODE pin is Low.

GND Ground

Low supply voltage.

I/O Input/Output (Input, Output)

The I/O pin functions as an input, output, three-state, or bidirectional buffer. Input and output levels are compatible with standard TTL and CMOS specifications. Unused I/O pins are automatically driven Low by the ALS software.

MODE Mode (Input)

The MODE pin controls the use of multifunction pins (DCLK, PRA, PRB, SDI). When the MODE pin is High, the special functions are active. When the MODE pin is Low, the pins function as I/Os. To provide Actionprobe capability, the MODE pin should be terminated to GND through a 10K resistor so that the MODE pin can be pulled High when required.

NC No Connection

This pin is not connected to circuitry within the device.

PRA Probe A (Output)

The Probe A pin is used to output data from any user-defined design node within the device. This independent diagnostic pin can be used in conjunction with the Probe B pin to allow real-time diagnostic output of any signal path within the device. The Probe A pin can be used as a user-defined I/O when debugging has been completed. The pin’s probe capabilities can be permanently disabled to protect programmed design confidentiality. PRA is active when the MODE pin is High. This pin functions as an I/O when the MODE pin is Low.

PRB Probe B (Output)

The Probe B pin is used to output data from any user-defined design node within the device. This independent diagnostic pin can be used in conjunction with the Probe A pin to allow real-time diagnostic output of any signal path within the device. The Probe B pin can be used as a user-defined I/O when debugging has been completed. The pin’s probe capabilities can be permanently disabled to protect programmed design confidentiality. PRB is active when the MODE pin is High. This pin functions as an I/O when the MODE pin is Low.

SDI Serial Data Input (Input)

Serial data input for diagnostic probe and device programming. SDI is active when the MODE pin is High. This pin functions as an I/O when the MODE pin is Low.

SDO Serial Data Output (Output)

Serial data output for diagnostic probe. SDO is active when the MODE pin is High. This pin functions as an I/O when the MODE pin is Low.

VCC 5.0 V Supply Voltage

High supply voltage.

P13	SDO

Notes:

1. All unlisted pin numbers are user I/Os.
2. MODE pin should be terminated to GND through a 10K resistor to enable Actionprobe usage; otherwise it can be terminated directly to GND.

4 – Datasheet Information

List of Changes

The following table lists critical changes that were made in each version of the datasheet.

Revision	Changes	Page
Revision 8 (January 2012)	The ACT 2 datasheet was formatted newly in the style used for current datasheets. The same information is present (other than noted in the list of changes for this revision) but divided into chapters.	N/A
	Package names used in Table 1 • ACT 2 Product Family Profile and throughout the document were revised to match standards given in *Package Mechanical Drawings* (SAR 27395).	I
	The description for SDO pins had earlier been removed from the datasheet and has now been included again, in the "Pin Descriptions" section (SAR 35819).	2-21
	SDO pin numbers had earlier been removed from package pin assignment tables in the datasheet, and have now been restored to the pin tables (SAR 35819).	3-2
Revision 7 (June 2006)	The "Ordering Information" section was revised to include RoHS information.	II
Revision 6 (December 2000)	In the "PG176" package, pin A3 was incorrectly assigned as CLKA, I/O. A3 is a user I/O. Pin A9 is CLKA, I/O.	3-21

Datasheet Categories

Categories

In order to provide the latest information to designers, some datasheet parameters are published before data has been fully characterized from silicon devices. The data provided for a given device is designated as either "Product Brief," "Advance," "Preliminary," or "Production." The definitions of these categories are as follows:

Product Brief

The product brief is a summarized version of a datasheet (advance or production) and contains general product information. This document gives an overview of specific device and family information.

Advance

This version contains initial estimated information based on simulation, other products, devices, or speed grades. This information can be used as estimates, but not for production. This label only applies to the DC and Switching Characteristics chapter of the datasheet and will only be used when the data has not been fully characterized.

Preliminary

The datasheet contains information based on simulation and/or initial characterization. The information is believed to be correct, but changes are possible.

Production

This version contains information that is considered to be final.

Export Administration Regulations (EAR)

The products described in this document are subject to the Export Administration Regulations (EAR). They could require an approved export license prior to export from the United States. An export includes release of product or disclosure of technology to a foreign national inside or outside the United States.

Safety Critical, Life Support, and High-Reliability Applications Policy

The products described in this advance status document may not have completed the Microsemi qualification process. Products may be amended or enhanced during the product introduction and qualification process, resulting in changes in device functionality or performance. It is the responsibility of each customer to ensure the fitness of any product (but especially a new product) for a particular purpose, including appropriateness for safety-critical, life-support, and other high-reliability applications. Consult the Microsemi SoC Products Group Terms and Conditions for specific liability exclusions relating to life-support applications. A reliability report covering all of the SoC Products Group’s products is available at http://www.microsemi.com/soc/documents/ORT_Report.pdf. Microsemi also offers a variety of enhanced qualification and lot acceptance screening procedures. Contact your local sales office for additional reliability information.
