Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	684
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	104
Number of Gates	4000
Voltage - Supply	4.5V ~ 5.5V
Mounting Type	Through Hole
Operating Temperature	-55°C ~ 125°C (TJ)
Package / Case	132-BCPGA
Supplier Device Package	132-CPGA (34.54x34.54)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/a1240a-pg132b

Ordering Information

2 – Detailed Specifications

Operating Conditions

Table 2-1 • **Absolute Maximum Ratings[1]**

Symbol	Parameter	Limits	Units
VCC	DC supply voltage	–0.5 to +7.0	V
VI	Input voltage	–0.5 to VCC + 0.5	V
VO	Output voltage	–0.5 to VCC + 0.5	V
IIO	I/O source sink current[2]	±20	mA
T_{STG}	Storage temperature	–65 to +150	°C

Notes:

1. *Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. Exposure to absolute maximum rated conditions for extended periods may affect device reliability. Device should not be operated outside the recommended operating conditions.*
2. *Device inputs are normally high impedance and draw extremely low current. However, when input voltage is greater than VCC + 0.5 V for less than GND –0.5 V, the internal protection diodes will be forward biased and can draw excessive current.*

Table 2-2 • **Recommended Operating Conditions**

Parameter	Commercial	Industrial	Military	Units
Temperature range*	0 to +70	–40 to +85	–55 to +125	°C
Power supply tolerance	±5	±10	±10	%VCC

*Note: *Ambient temperature (T_A) is used for commercial and industrial; case temperature (T_C) is used for military.*

Package Thermal Characteristics

The device junction to case thermal characteristic is θjc, and the junction to ambient air characteristic is θja. The thermal characteristics for θja are shown with two different air flow rates.

Maximum junction temperature is 150°C.

A sample calculation of the absolute maximum power dissipation allowed for a PQ160 package at commercial temperature and still air is as follows:

$$\frac{\text{Max. junction temp. (°C)} - \text{Max. ambient temp. (°C)}}{\theta_{ja}\text{°C/W}} = \frac{150\text{°C} - 70\text{°C}}{33\text{°C/W}} = 2.4\ \text{W}$$

EQ 1

Table 2-4 • **Package Thermal Characteristics**

Package Type*	**Pin Count**	θ_{jc}	θ_{ja} **Still Air**	θ_{ja} **300 ft./min.**	**Units**
Ceramic Pin Grid Array	100	5	35	17	°C/W
	132	5	30	15	°C/W
	176	8	23	12	°C/W
Ceramic Quad Flatpack	172	8	25	15	°C/W
Plastic Quad Flatpack[1]	100	13	48	40	°C/W
	144	15	40	32	°C/W
	160	15	38	30	°C/W
Plastic Leaded Chip Carrier	84	12	37	28	°C/W
Very Thin Quad Flatpack	100	12	43	35	°C/W
Thin Quad Flatpack	176	15	32	25	°C/W

Notes: (Maximum Power in Still Air)

1. *Maximum power dissipation values for PQFP packages are 1.9 W (PQ100), 2.3 W (PQ144), and 2.4 W (PQ160).*
2. *Maximum power dissipation for PLCC packages is 2.7 W.*
3. *Maximum power dissipation for VQFP packages is 2.3 W.*
4. *Maximum power dissipation for TQFP packages is 3.1 W.*

Power Dissipation

$$P = [I_{CC\ standby} + I_{CCactive}] * V_{CC} + I_{OL} * V_{OL} * N + I_{OH} * (V_{CC} - V_{OH}) * M$$

EQ 2

where:

$I_{CC\ standby}$ is the current flowing when no inputs or outputs are changing

$I_{CCactive}$ is the current flowing due to CMOS switching.

I_{OL} and I_{OH} are TTL sink/source currents.

V_{OL} and V_{OH} are TTL level output voltages.

N is the number of outputs driving TTL loads to V_{OL}.

M is the number of outputs driving TTL loads to V_{OH}.

An accurate determination of N and M is problematical because their values depend on the family type, design details, and on the system I/O. The power can be divided into two components: static and active.

To calculate the active power dissipated from the complete design, the switching frequency of each part of the logic must be known. EQ 4 shows a piece-wise linear summation over all components.

$$\text{Power} = VCC^2 * [(m * C_{EQM} * f_m)_{modules} + (n * C_{EQI} * f_n)_{inputs}$$
$$+ (p * (C_{EQO} + C_L) * fp)_{outputs}$$
$$+ 0.5 * (q1 * C_{EQCR} * f_{q1})_{routed\_Clk1} + (r1 * f_{q1})_{routed\_Clk1}$$
$$+ 0.5 * (q2 * C_{EQCR} * f_{q2})_{routed\_Clk2} + (r_2 * f_{q2})_{routed\_Clk2}$$

EQ 4

Where:

m = Number of logic modules switching at f_m

n = Number of input buffers switching at f_n

p = Number of output buffers switching at f_p

q1 = Number of clock loads on the first routed array clock

q2 = Number of clock loads on the second routed array clock

r_1 = Fixed capacitance due to first routed array clock

r_2 = Fixed capacitance due to second routed array clock

C_{EQM} = Equivalent capacitance of logic modules in pF

C_{EQI} = Equivalent capacitance of input buffers in pF

C_{EQO} = Equivalent capacitance of output buffers in pF

C_{EQCR} = Equivalent capacitance of routed array clock in pF

C_L = Output lead capacitance in pF

f_m = Average logic module switching rate in MHz

f_n = Average input buffer switching rate in MHz

f_p = Average output buffer switching rate in MHz

f_{q1} = Average first routed array clock rate in MHz

f_{q2} = Average second routed array clock rate in MHz

Table 2-7 • **Fixed Capacitance Values for Microsemi FPGAs**

Device Type	r1, routed_Clk1	r2, routed_Clk2
A1225A	106	106.0

		FO = 256	4.1		5.0		5.8		
t_{PWL}	Minimum Pulse Width Low	FO = 32	3.8		4.5		5.5		ns
		FO = 256	4.1		5.0		5.8		
t_{CKSW}	Maximum Skew	FO = 32		0.5		0.5		0.5	ns
		FO = 256		2.5		2.5		2.5	
t_{SUEXT}	Input Latch External Setup	FO = 32	0.0		0.0		0.0		ns
		FO = 256	0.0		0.0		0.0		
t_{HEXT}	Input Latch External Hold	FO = 32	7.0		7.0		7.0		ns
		FO = 256	11.2		11.2		11.2		
t_P	Minimum Period	FO = 32	8.1		9.1		11.1		ns
		FO = 256	8.8		10.0		11.7		
f_{MAX}	Maximum Frequency	FO = 32		125.0		110.0		90.0	ns
		FO = 256		115.0		100.0		85.0	

*Note: *These parameters should be used for estimating device performance. Optimization techniques may further reduce delays by 0 to 4 ns. Routing delays are for typical designs across worst-case operating conditions. Post-route timing analysis or simulation is required to determine actual worst-case performance. Post-route timing is based on actual routing delay measurements performed on the device prior to shipment.*

A1280A Timing Characteristics

f_{MAX}	Flip-Flop (Latch) Clock Frequency		85.0		75.0		50.0	MHz

Notes:

1. *For dual-module macros, use $t_{PD1} + t_{RD1} + t_{PDn}$, $t_{CO} + t_{RD1} + t_{PDn}$, or $t_{PD1} + t_{RD1} + t_{SUD}$—whichever is appropriate.*
2. *Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual worst-case performance. Post-route timing is based on actual routing delay measurements performed on the device prior to shipment.*
3. *Data applies to macros based on the S-module. Timing parameters for sequential macros constructed from C-modules can be obtained from the DirectTime Analyzer utility.*
4. *Setup and hold timing parameters for the Input Buffer Latch are defined with respect to the PAD and the D input. External setup/hold timing parameters must account for delay from an external PAD signal to the G inputs. Delay from an external PAD signal to the G input subtracts (adds) to the internal setup (hold) time.*

Pin Descriptions

CLKA Clock A (Input)

TTL Clock input for clock distribution networks. The Clock input is buffered prior to clocking the logic modules. This pin can also be used as an I/O.

CLKB Clock B (Input)

TTL Clock input for clock distribution networks. The Clock input is buffered prior to clocking the logic modules. This pin can also be used as an I/O.

DCLK Diagnostic Clock (Input)

TTL Clock input for diagnostic probe and device programming. DCLK is active when the MODE pin is High. This pin functions as an I/O when the MODE pin is Low.

GND Ground

Low supply voltage.

I/O Input/Output (Input, Output)

The I/O pin functions as an input, output, three-state, or bidirectional buffer. Input and output levels are compatible with standard TTL and CMOS specifications. Unused I/O pins are automatically driven Low by the ALS software.

MODE Mode (Input)

The MODE pin controls the use of multifunction pins (DCLK, PRA, PRB, SDI). When the MODE pin is High, the special functions are active. When the MODE pin is Low, the pins function as I/Os. To provide Actionprobe capability, the MODE pin should be terminated to GND through a 10K resistor so that the MODE pin can be pulled High when required.

NC No Connection

This pin is not connected to circuitry within the device.

PRA Probe A (Output)

The Probe A pin is used to output data from any user-defined design node within the device. This independent diagnostic pin can be used in conjunction with the Probe B pin to allow real-time diagnostic output of any signal path within the device. The Probe A pin can be used as a user-defined I/O when debugging has been completed. The pin's probe capabilities can be permanently disabled to protect programmed design confidentiality. PRA is active when the MODE pin is High. This pin functions as an I/O when the MODE pin is Low.

PRB Probe B (Output)

The Probe B pin is used to output data from any user-defined design node within the device. This independent diagnostic pin can be used in conjunction with the Probe A pin to allow real-time diagnostic output of any signal path within the device. The Probe B pin can be used as a user-defined I/O when debugging has been completed. The pin's probe capabilities can be permanently disabled to protect programmed design confidentiality. PRB is active when the MODE pin is High. This pin functions as an I/O when the MODE pin is Low.

SDI Serial Data Input (Input)

Serial data input for diagnostic probe and device programming. SDI is active when the MODE pin is High. This pin functions as an I/O when the MODE pin is Low.

SDO Serial Data Output (Output)

Serial data output for diagnostic probe. SDO is active when the MODE pin is High. This pin functions as an I/O when the MODE pin is Low.

VCC 5.0 V Supply Voltage

High supply voltage.

Datasheet Categories

Categories

In order to provide the latest information to designers, some datasheet parameters are published before data has been fully characterized from silicon devices. The data provided for a given device is designated as either "Product Brief," "Advance," "Preliminary," or "Production." The definitions of these categories are as follows:

Product Brief

The product brief is a summarized version of a datasheet (advance or production) and contains general product information. This document gives an overview of specific device and family information.

Advance

This version contains initial estimated information based on simulation, other products, devices, or speed grades. This information can be used as estimates, but not for production. This label only applies to the DC and Switching Characteristics chapter of the datasheet and will only be used when the data has not been fully characterized.

Preliminary

The datasheet contains information based on simulation and/or initial characterization. The information is believed to be correct, but changes are possible.

Production

This version contains information that is considered to be final.

Export Administration Regulations (EAR)

The products described in this document are subject to the Export Administration Regulations (EAR). They could require an approved export license prior to export from the United States. An export includes release of product or disclosure of technology to a foreign national inside or outside the United States.

Safety Critical, Life Support, and High-Reliability Applications Policy

The products described in this advance status document may not have completed the Microsemi qualification process. Products may be amended or enhanced during the product introduction and qualification process, resulting in changes in device functionality or performance. It is the responsibility of each customer to ensure the fitness of any product (but especially a new product) for a particular purpose, including appropriateness for safety-critical, life-support, and other high-reliability applications. Consult the Microsemi SoC Products Group Terms and Conditions for specific liability exclusions relating to life-support applications. A reliability report covering all of the SoC Products Group’s products is available at http://www.microsemi.com/soc/documents/ORT_Report.pdf. Microsemi also offers a variety of enhanced qualification and lot acceptance screening procedures. Contact your local sales office for additional reliability information.
