Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details	
Product Status	Obsolete
Number of LABs/CLBs	1232
Number of Logic Elements/Cells	-
Total RAM Bits	-
Number of I/O	125
Number of Gates	8000
Voltage - Supply	4.5V ~ 5.5V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 85°C (TA)
Package / Case	160-BQFP
Supplier Device Package	160-PQFP (28x28)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/a1280a-pq160i

Product Plan

Device/Package	Speed Grade[1]			Application[1]			
	Std.	–1	–2	C	I	M	B
A1225A Device

1 – ACT 2 Family Overview

General Description

The ACT 2 family represents Actel's second generation of field programmable gate arrays (FPGAs). The ACT 2 family presents a two-module architecture, consisting of C-modules and S-modules. These modules are optimized for both combinatorial and sequential designs. Based on Actel's patented channeled array architecture, the ACT 2 family provides significant enhancements to gate density and performance while maintaining downward compatibility with the ACT 1 design environment and upward compatibility with the ACT 3 design environment. The devices are implemented in silicon gate, 1.0-µm, two-level metal CMOS, and employ Actel's PLICE® antifuse technology. This revolutionary architecture offers gate array design flexibility, high performance, and fast time-to-production with user programming. The ACT 2 family is supported by the Designer and Designer Advantage Systems, which offers automatic pin assignment, validation of electrical and design rules, automatic placement and routing, timing analysis, user programming, and diagnostic probe capabilities. The systems are supported on the following platforms: 386/486™ PC, Sun™, and HP™ workstations. The systems provide CAE interfaces to the following design environments: Cadence, Viewlogic®, Mentor Graphics®, and OrCAD™.

2 – Detailed Specifications

Operating Conditions

Table 2-1 • **Absolute Maximum Ratings[1]**

Symbol	Parameter	Limits	Units
VCC	DC supply voltage	–0.5 to +7.0	V
VI	Input voltage	–0.5 to VCC + 0.5	V
VO	Output voltage	–0.5 to VCC + 0.5	V
IIO	I/O source sink current[2]	±20	mA
T_{STG}	Storage temperature	–65 to +150	°C

Notes:

1. *Stresses beyond those listed under "Absolute Maximum Ratings" may cause permanent damage to the device. Exposure to absolute maximum rated conditions for extended periods may affect device reliability. Device should not be operated outside the recommended operating conditions.*
2. *Device inputs are normally high impedance and draw extremely low current. However, when input voltage is greater than VCC + 0.5 V for less than GND –0.5 V, the internal protection diodes will be forward biased and can draw excessive current.*

Table 2-2 • **Recommended Operating Conditions**

Parameter	Commercial	Industrial	Military	Units
Temperature range*	0 to +70	–40 to +85	–55 to +125	°C
Power supply tolerance	±5	±10	±10	%VCC

*Note: *Ambient temperature (T_A) is used for commercial and industrial; case temperature (T_C) is used for military.*

Table 2-3 • **Electrical Specifications**

Symbol	Parameter	Commercial		Industrial		Military		Units
		Min.	Max.	Min.	Max.	Min.	Max.	
VOH[1]	(IOH = –10 mA)[2]	2.4	–	–	–	–	–	V
	(IOH = –6 mA)	3.84	–	–	–	–	–	V
	(IOH = –4 mA)	–	–	3.7	–	3.7	–	V
VOL[1]	(IOL = 10 mA)[2]	–	0.5	–	–	–	–	V
	(IOL = 6 mA)	–	0.33	–	0.40	–	0.40	V
VIL		–0.3	0.8	–0.3	0.8	–0.3	0.8	V
VIH		2.0	VCC + 0.3	2.0	VCC + 0.3	2.0	VCC + 0.3	V
Input Transition Time t_R, t_F[2]		–	500	–	500	–	500	ns
C_{IO} I/O capacitance[2,3]		–	10	–	10	–	10	pF
Standby Current, ICC[4] (typical = 1 mA)		–	2	–	10	–	20	mA
Leakage Current[5]		–10	+10	–10	+10	–10	+10	µA
ICC(D)	Dynamic VCC supply current. See the Power Dissipation section.							

Notes:

1. *Only one output tested at a time. VCC = minimum.*
2. *Not tested, for information only.*
3. *Includes worst-case PG176 package capacitance. VOUT = 0 V, f = 1 MHz*
4. *All outputs unloaded. All inputs = VCC or GND, typical ICC = 1 mA. ICC limit includes IPP and ISV during normal operations.*
5. *VOUT, VIN = VCC or GND.*

Static Power Component

Microsemi FPGAs have small static power components that result in lower power dissipation than PALs or PLDs. By integrating multiple PALs/PLDs into one FPGA, an even greater reduction in board-level power dissipation can be achieved.

The power due to standby current is typically a small component of the overall power. Standby power is calculated in Table 2-5 for commercial, worst case conditions.

Table 2-5 • **Standby Power Calculation**

ICC	VCC	Power
2 mA	5.25 V	10.5 mW

The static power dissipated by TTL loads depends on the number of outputs driving high or low and the DC load current. Again, this value is typically small. For instance, a 32-bit bus sinking 4 mA at 0.33 V will generate 42 mW with all outputs driving low, and 140 mW with all outputs driving high. The actual dissipation will average somewhere between as I/Os switch states with time.

Active Power Component

Power dissipation in CMOS devices is usually dominated by the active (dynamic) power dissipation. This component is frequency dependent, a function of the logic and the external I/O. Active power dissipation results from charging internal chip capacitances of the interconnect, unprogrammed antifuses, module inputs, and module outputs, plus external capacitance due to PC board traces and load device inputs.

An additional component of the active power dissipation is the totem-pole current in CMOS transistor pairs. The net effect can be associated with an equivalent capacitance that can be combined with frequency and voltage to represent active power dissipation.

Equivalent Capacitance

The power dissipated by a CMOS circuit can be expressed by EQ 3.

$$\text{Power } (\mu W) = C_{EQ} * VCC^2 * F \qquad \textit{EQ 3}$$

Where:

C_{EQ} is the equivalent capacitance expressed in pF.

VCC is the power supply in volts.

F is the switching frequency in MHz.

Equivalent capacitance is calculated by measuring ICC active at a specified frequency and voltage for each circuit component of interest. Measurements have been made over a range of frequencies at a fixed value of VCC. Equivalent capacitance is frequency independent so that the results may be used over a wide range of operating conditions. Equivalent capacitance values are shown in Table 2-6.

Table 2-6 • **CEQ Values for Microsemi FPGAs**

Item	CEQ Value
Modules (C_{EQM})	5.8
Input Buffers (C_{EQI})	12.9
Output Buffers (C_{EQO})	23.8
Routed Array Clock Buffer Loads (C_{EQCR})	3.9

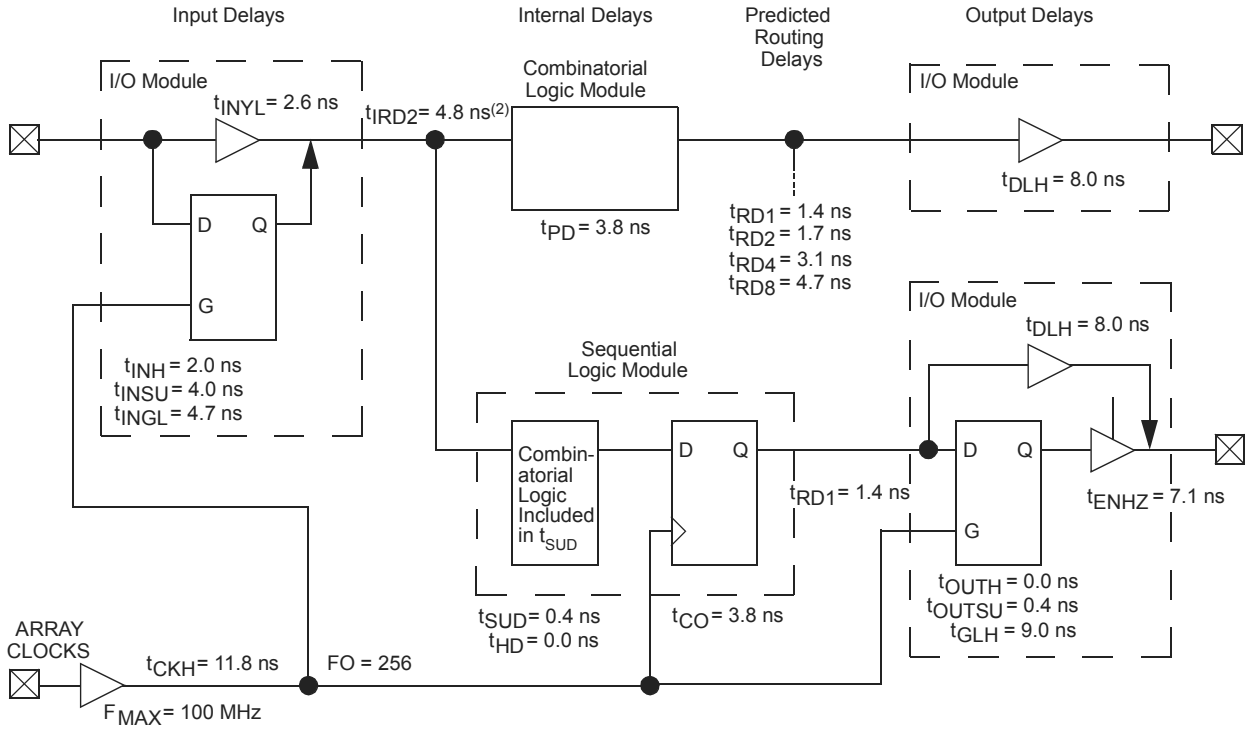
Determining Average Switching Frequency

To determine the switching frequency for a design, you must have a detailed understanding of the data input values to the circuit. The following guidelines are meant to represent worst-case scenarios so that they can be generally used to predict the upper limits of power dissipation. These guidelines are given in Table 2-8.

Table 2-8 • **Guidelines for Predicting Power Dissipation**

Data	Value
Logic Modules (m)	80% of modules
Inputs switching (n)	# inputs/4
Outputs switching (p)	# output/4
First routed array clock loads (q1)	40% of sequential modules
Second routed array clock loads (q2)	40% of sequential modules
Load capacitance (C_L)	35 pF
Average logic module switching rate (f_m)	F/10
Average input switching rate (f_n)	F/5
Average output switching rate (f_p)	F/10
Average first routed array clock rate (f_{q1})	F
Average second routed array clock rate (f_{q2})	F/2

ACT 2 Timing Model[1]



Notes:

1. *Values shown for A1240A-2 at worst-case commercial conditions.*
2. *Input module predicted routing delay*

Figure 2-1 • **Timing Model**

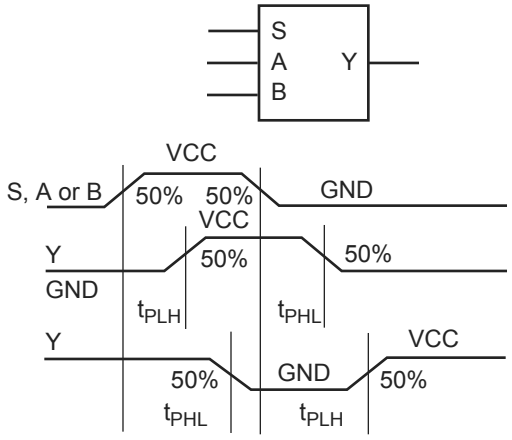


Figure 2-5 • **Module Delays**

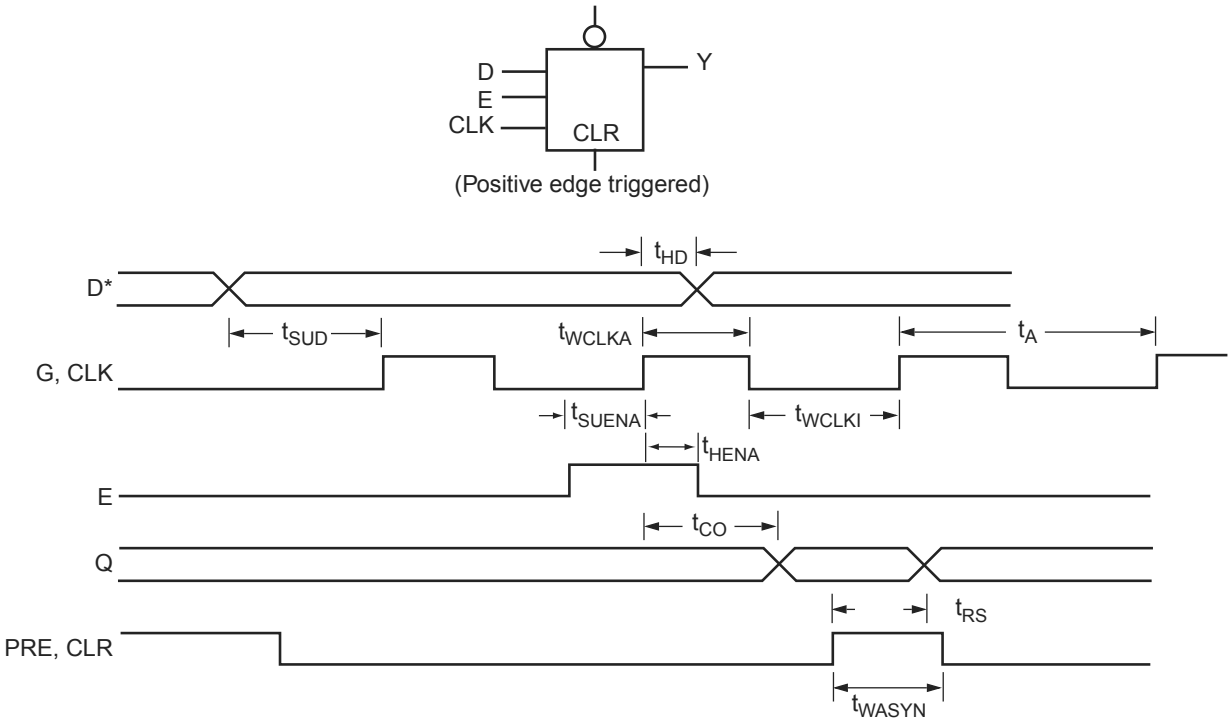
Sequential Module Timing Characteristics



Note: D represents all data functions involving A, B, and S for multiplexed flip-flops.

Figure 2-6 • **Flip-Flops and Latches**

Timing Derating Factor (Temperature and Voltage)

Table 2-9 • **Timing Derating Factor (Temperature and Voltage)**

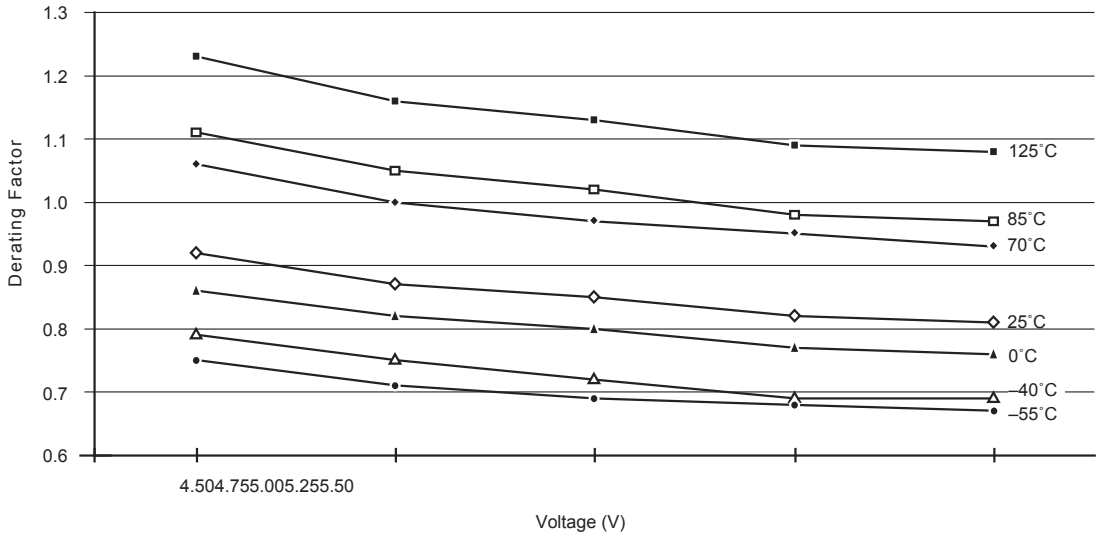
(Commercial Minimum/Maximum Specification) x	Industrial		Military	
	Min.	**Max.**	**Min.**	Max.
	0.69	1.11	0.67	1.23

Table 2-10 • **Timing Derating Factor for Designs at Typical Temperature (T_J = 25°C) and Voltage (5.0 V)**

(Commercial Maximum Specification) x	0.85

Table 2-11 • **Temperature and Voltage Derating Factors (normalized to Worst-Case Commercial, TJ = 4.75 V, 70°C)**

	–55	**–40**	**0**	**25**	**70**	**85**	**125**
4.50	0.75	0.79	0.86	0.92	1.06	1.11	1.23
4.75	0.71	0.75	0.82	0.87	1.00	1.05	1.13
5.00	0.69	0.72	0.80	0.85	0.97	1.02	1.13
5.25	0.68	0.69	0.77	0.82	0.95	0.98	1.09
5.50	0.67	0.69	0.76	0.81	0.93	0.97	1.08



Note: This derating factor applies to all routing and propagation delays.

Figure 2-9 • **Junction Temperature and Voltage Derating Curves (normalized to Worst-Case Commercial, T_J = 4.75 V, 70°C)**

A1240A Timing Characteristics

***Table 2-15* • A1240A Worst-Case Commercial Conditions, VCC = 4.75 V, T_J = 70°C**

Logic Module Propagation Delays[1]		**–2 Speed[3]**		**–1 Speed**		**Std. Speed**		**Units**
Parameter/Description		**Min.**	**Max.**	**Min.**	**Max.**	**Min.**	**Max.**	
t_{PD1}	Single Module		3.8		4.3		5.0	ns
t_{CO}	Sequential Clock to Q		3.8		4.3		5.0	ns
t_{GO}	Latch G to Q		3.8		4.3		5.0	ns
t_{RS}	Flip-Flop (Latch) Reset to Q		3.8		4.3		5.0	ns
Predicted Routing Delays[2]								
t_{RD1}	FO = 1 Routing Delay		1.4		1.5		1.8	ns
t_{RD2}	FO = 2 Routing Delay		1.7		2.0		2.3	ns
t_{RD3}	FO = 3 Routing Delay		2.3		2.6		3.0	ns
t_{RD4}	FO = 4 Routing Delay		3.1		3.5		4.1	ns
t_{RD8}	FO = 8 Routing Delay		4.7		5.4		6.3	ns

t_{INH}	Input Buffer Latch Hold	0.0		0.0		0.0		ns
t_{INSU}	Input Buffer Latch Setup	0.4		0.4		0.5		ns
t_{OUTH}	Output Buffer Latch Hold	0.0		0.0		0.0		ns
t_{OUTSU}	Output Buffer Latch Setup	0.4		0.4		0.5		ns
f_{MAX}	Flip-Flop (Latch) Clock Frequency		100.0		80.0		66.0	MHz

Notes:

1. *For dual-module macros, use $t_{PD1} + t_{RD1} + t_{PDn}$, $t_{CO} + t_{RD1} + t_{PDn}$, or $t_{PD1} + t_{RD1} + t_{SUD}$—whichever is appropriate.*
2. *Routing delays are for typical designs across worst-case operating conditions. These parameters should be used for estimating device performance. Post-route timing analysis or simulation is required to determine actual worst-case performance. Post-route timing is based on actual routing delay measurements performed on the device prior to shipment.*
3. *Data applies to macros based on the S-module. Timing parameters for sequential macros constructed from C-modules can be obtained from the DirectTime Analyzer utility.*
4. *Setup and hold timing parameters for the Input Buffer Latch are defined with respect to the PAD and the D input. External setup/hold timing parameters must account for delay from an external PAD signal to the G inputs. Delay from an external PAD signal to the G input subtracts (adds) to the internal setup (hold) time.*

A1240A Timing Characteristics (continued)

***Table 2-16* • A1240A Worst-Case Commercial Conditions, VCC = 4.75 V, T_J = 70°C**

I/O Module Input Propagation Delays			–2 Speed		–1 Speed		Std. Speed		Units

161	GND
166	VCC
171	DCLK, I/O

Notes:

1. All unlisted pin numbers are user I/Os.
2. MODE pin should be terminated to GND through a 10K resistor to enable Actionprobe usage; otherwise it can be terminated directly to GND.

4 – Datasheet Information

List of Changes

The following table lists critical changes that were made in each version of the datasheet.

Revision	Changes	Page
Revision 8 (January 2012)	The ACT 2 datasheet was formatted newly in the style used for current datasheets. The same information is present (other than noted in the list of changes for this revision) but divided into chapters.	N/A
	Package names used in Table 1 • ACT 2 Product Family Profile and throughout the document were revised to match standards given in *Package Mechanical Drawings* (SAR 27395).	I
	The description for SDO pins had earlier been removed from the datasheet and has now been included again, in the "Pin Descriptions" section (SAR 35819).	2-21
	SDO pin numbers had earlier been removed from package pin assignment tables in the datasheet, and have now been restored to the pin tables (SAR 35819).	3-2
Revision 7 (June 2006)	The "Ordering Information" section was revised to include RoHS information.	II
Revision 6 (December 2000)	In the "PG176" package, pin A3 was incorrectly assigned as CLKA, I/O. A3 is a user I/O. Pin A9 is CLKA, I/O.	3-21

Microsemi Corporation (NASDAQ: MSCC) offers a comprehensive portfolio of semiconductor solutions for: aerospace, defense and security; enterprise and communications; and industrial and alternative energy markets. Products include high-performance, high-reliability analog and RF devices, mixed signal and RF integrated circuits, customizable SoCs, FPGAs, and complete subsystems. Microsemi is headquartered in Aliso Viejo, Calif. Learn more at **www.microsemi.com**.
