
Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	80C51
Core Size	8-Bit
Speed	40/20MHz
Connectivity	UART/USART
Peripherals	POR, PWM, WDT
Number of I/O	32
Program Memory Size	64KB (64K x 8)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	1K x 8
Voltage - Supply (Vcc/Vdd)	4.5V ~ 5.5V
Data Converters	-
Oscillator Type	Internal
Operating Temperature	0°C ~ 70°C (TA)
Mounting Type	Surface Mount
Package / Case	44-LCC (J-Lead)
Supplier Device Package	44-PLCC (16.6x16.6)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/ts87c51rd2-mcb

4. SFR Mapping

The Special Function Registers (SFRs) of the TS80C51Rx2 fall into the following categories:

- C51 core registers: ACC, B, DPH, DPL, PSW, SP, AUXR1
- I/O port registers: P0, P1, P2, P3, P4, P5
- Timer registers: T2CON, T2MOD, TCON, TH0, TH1, TH2, TMOD, TL0, TL1, TL2, RCAP2L, RCAP2H
- Serial I/O port registers: SADDR, SADEN, SBUF, SCON
- Power and clock control registers: PCON
- HDW Watchdog Timer Reset: WDTRST, WDTPRG
- PCA registers: CL, CH, CCAPiL, CCAPiH, CCON, CMOD, CCAPMi
- Interrupt system registers: IE, IP, IPH
- Others: AUXR, CKCON

NIC: No InternalConnection

5.1. Pin Description for 64/68 pin Packages

Port 4 and Port 5 are 8-bit bidirectional I/O ports with internal pull-ups. Pins that have 1 written to them are pulled high by the internal pull ups and can be used as inputs.

As inputs, pins that are externally pulled low will source current because of the internal pull-ups.

Refer to the previous pin description for other pins.

Bit Number	Bit Mnemonic	Description
7	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
6	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
5	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
4	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
3	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
2	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
1	T2OE	**Timer 2 Output Enable bit** Clear to program P1.0/T2 as clock input or I/O port. Set to program P1.0/T2 as clock output.
0	DCEN	**Down Counter Enable bit** Clear to disable timer 2 as up/down counter. Set to enable timer 2 as up/down counter.

Reset Value = XXXX XX00b
Not bit addressable

6.5. Programmable Counter Array PCA

The PCA provides more timing capabilities with less CPU intervention than the standard timer/counters. Its advantages include reduced software overhead and improved accuracy. The PCA consists of a dedicated timer/counter which serves as the time base for an array of five compare/ capture modules. Its clock input can be programmed to count any one of the following signals:

- Oscillator frequency ÷ 12 (÷ 6 in X2 mode)
- Oscillator frequency ÷ 4 (÷ 2 in X2 mode)
- Timer 0 overflow
- External input on ECI (P1.2)

Each compare/capture modules can be programmed in any one of the following modes:

- rising and/or falling edge capture,
- software timer,
- high-speed output, or
- pulse width modulator.

Module 4 can also be programmed as a watchdog timer (See Section "PCA Watchdog Timer", page 33).

When the compare/capture modules are programmed in the capture mode, software timer, or high speed output mode, an interrupt can be generated when the module executes its function. All five modules plus the PCA timer overflow share one interrupt vector.

The PCA timer/counter and compare/capture modules share Port 1 for external I/O. These pins are listed below. If the port is not used for the PCA, it can still be used for standard I/O.

PCA component	External I/O Pin
16-bit Counter	P1.2 / ECI
16-bit Module 0	P1.3 / CEX0
16-bit Module 1	P1.4 / CEX1
16-bit Module 2	P1.5 / CEX2
16-bit Module 3	P1.6 / CEX3
16-bit Module 4	P1.7 / CEX4

The PCA timer is a common time base for all five modules (See Figure 7). The timer count source is determined from the CPS1 and CPS0 bits in the **CMOD SFR** (See Table 8) and can be programmed to run at:

- 1/12 the oscillator frequency. (Or 1/6 in X2 Mode)
- 1/4 the oscillator frequency. (Or 1/2 in X2 Mode)
- The Timer 0 overflow
- The input on the ECI pin (P1.2)

The CCON SFR contains the run control bit for the PCA and the flags for the PCA timer (CF) and each module (Refer to Table 9).

- Bit CR (CCON.6) must be set by software to run the PCA. The PCA is shut off by clearing this bit.
- Bit CF: The CF bit (CCON.7) is set when the PCA counter overflows and an interrupt will be generated if the ECF bit in the CMOD register is set. The CF bit can only be cleared by software.
- Bits 0 through 4 are the flags for the modules (bit 0 for module 0, bit 1 for module 1, etc.) and are set by hardware when either a match or a capture occurs. These flags also can only be cleared by software.

Table 9. CCON: PCA Counter Control Register

CCON Address 0D8H	CF	CR	-	CCF4	CCF3	CCF2	CCF1	CCF0
Reset value	0	0	X	0	0	0	0	0

Symbol	Function
CF	PCA Counter Overflow flag. Set by hardware when the counter rolls over. CF flags an interrupt if bit ECF in CMOD is set. CF may be set by either hardware or software but can only be cleared by software.
CR	PCA Counter Run control bit. Set by software to turn the PCA counter on. Must be cleared by software to turn the PCA counter off.
-	Not implemented, reserved for future use.[a]
CCF4	PCA Module 4 interrupt flag. Set by hardware when a match or capture occurs. Must be cleared by software.
CCF3	PCA Module 3 interrupt flag. Set by hardware when a match or capture occurs. Must be cleared by software.
CCF2	PCA Module 2 interrupt flag. Set by hardware when a match or capture occurs. Must be cleared by software.
CCF1	PCA Module 1 interrupt flag. Set by hardware when a match or capture occurs. Must be cleared by software.
CCF0	PCA Module 0 interrupt flag. Set by hardware when a match or capture occurs. Must be cleared by software.

a. User software should not write 1s to reserved bits. These bits may be used in future 8051 family products to invoke new features. In that case, the reset or inactive value of the new bit will be 0, and its active value will be 1. The value read from a reserved bit is indeterminate.

The watchdog timer function is implemented in module 4 (See Figure 10).

The PCA interrupt system is shown in Figure 8

Table 10. CCAPMn: PCA Modules Compare/Capture Control Registers

CCAPMn Address n = 0 - 4	CCAPM0=0DAH CCAPM1=0DBH CCAPM2=0DCH CCAPM3=0DDH CCAPM4=0DEH							
	-	ECOMn	CAPPn	CAPNn	MATn	TOGn	PWMm	ECCFn
Reset value	X	0	0	0	0	0	0	0

Symbol	Function
-	Not implemented, reserved for future use.[a]
ECOMn	Enable Comparator. ECOMn = 1 enables the comparator function.
CAPPn	Capture Positive, CAPPn = 1 enables positive edge capture.
CAPNn	Capture Negative, CAPNn = 1 enables negative edge capture.
MATn	Match. When MATn = 1, a match of the PCA counter with this module's compare/capture register causes the CCFn bit in CCON to be set, flagging an interrupt.
TOGn	Toggle. When TOGn = 1, a match of the PCA counter with this module's compare/capture register causes the CEXn pin to toggle.
PWMn	Pulse Width Modulation Mode. PWMn = 1 enables the CEXn pin to be used as a pulse width modulated output.
ECCFn	Enable CCF interrupt. Enables compare/capture flag CCFn in the CCON register to generate an interrupt.

a. User software should not write 1s to reserved bits. These bits may be used in future 8051 family products to invoke new features. In that case, the reset or inactive value of the new bit will be 0, and its active value will be 1. The value read from a reserved bit is indeterminate.

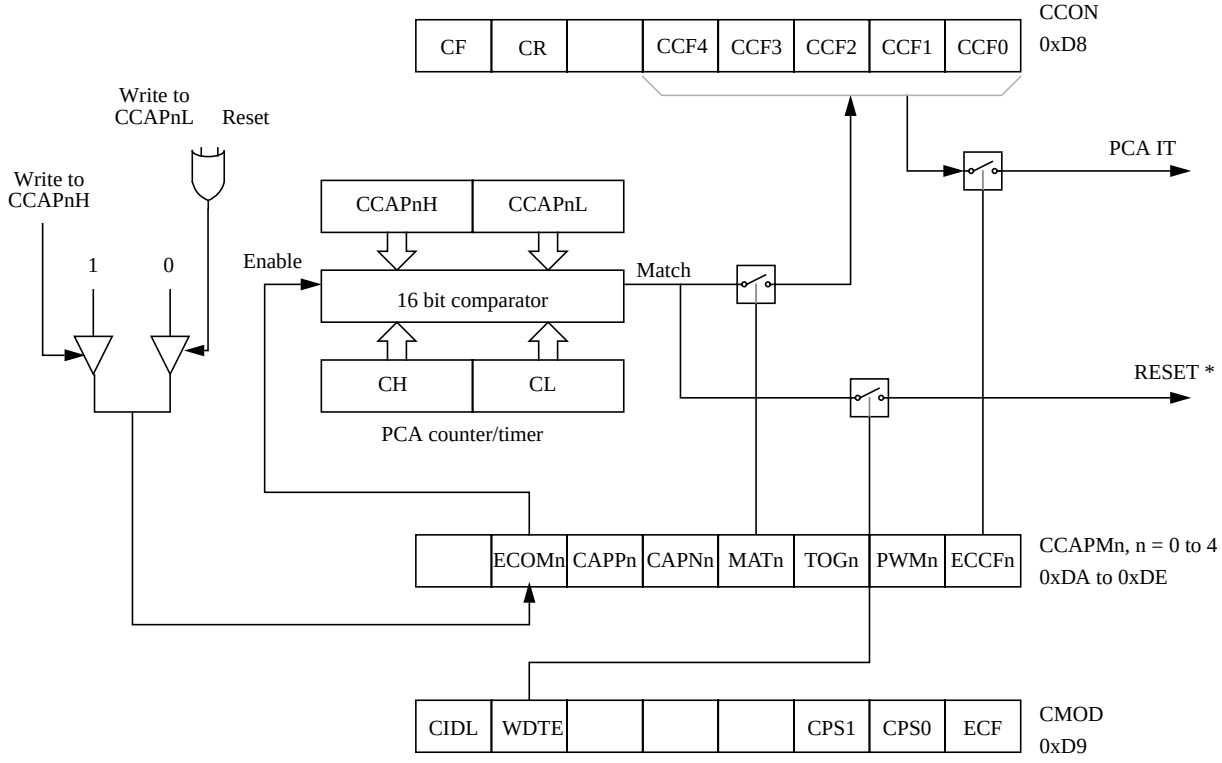
Table 11. PCA Module Modes (CCAPMn Registers)

ECOMn	CAPPn	CAPNn	MATn	TOGn	PWMm	ECCFn	Module Function
0	0	0	0	0	0	0	No Operation
X	1	0	0	0	0	X	16-bit capture by a positive-edge trigger on CEXn
X	0	1	0	0	0	X	16-bit capture by a negative trigger on CEXn
X	1	1	0	0	0	X	16-bit capture by a transition on CEXn
1	0	0	1	0	0	X	16-bit Software Timer / Compare mode.
1	0	0	1	1	0	X	16-bit High Speed Output
1	0	0	0	0	1	0	8-bit PWM
1	0	0	1	X	0	X	Watchdog Timer (module 4 only)

There are two additional registers associated with each of the PCA modules. They are CCAPnH and CCAPnL and these are the registers that store the 16-bit count when a capture occurs or a compare should occur. When a module is used in the PWM mode these registers are used to control the duty cycle of the output (See Table 12 & Table 13)

6.5.2. 16-bit Software Timer / Compare Mode

The PCA modules can be used as software timers by setting both the ECOM and MAT bits in the modules CCAPMn register. The PCA timer will be compared to the module's capture registers and when a match occurs an interrupt will occur if the CCFn (CCON SFR) and the ECCFn (CCAPMn SFR) bits for the module are both set (See Figure 10).



* Only for Module 4

Figure 10. PCA Compare Mode and PCA Watchdog Timer

Before enabling ECOM bit, CCAPnL and CCAPnH should be set with a non zero value, otherwise an unwanted match could happen. Writing to CCAPnH will set the ECOM bit.

Once ECOM set, writing CCAPnL will clear ECOM so that an unwanted match doesn't occur while modifying the compare value. Writing to CCAPnH will set ECOM. For this reason, user software should write CCAPnL first, and then CCAPnH. Of course, the ECOM bit can still be controlled by accessing to CCAPMn register.

Software may examine FE bit after each reception to check for data errors. Once set, only software or a reset can clear FE bit. Subsequently received frames with valid stop bits cannot clear FE bit. When FE feature is enabled, RI rises on stop bit instead of the last data bit (See Figure 14. and Figure 15.).

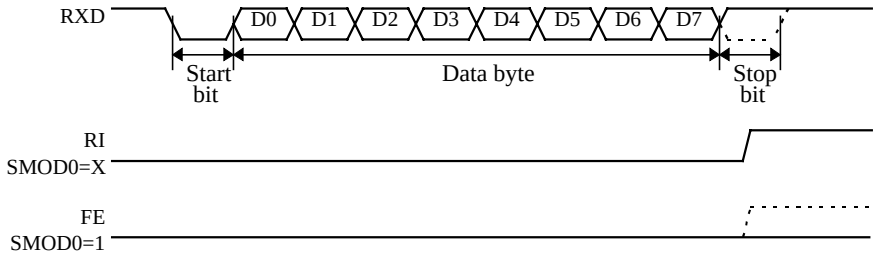


Figure 14. UART Timings in Mode 1

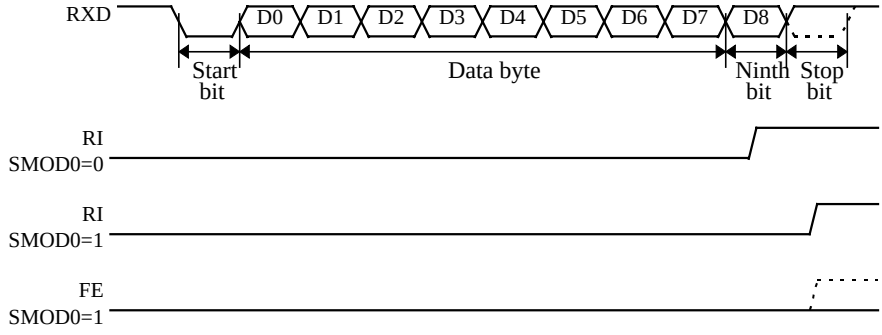

Figure 15. UART Timings in Modes 2 and 3

6.6.2. Automatic Address Recognition

The automatic address recognition feature is enabled when the multiprocessor communication feature is enabled (SM2 bit in SCON register is set).

Implemented in hardware, automatic address recognition enhances the multiprocessor communication feature by allowing the serial port to examine the address of each incoming command frame. Only when the serial port recognizes its own address, the receiver sets RI bit in SCON register to generate an interrupt. This ensures that the CPU is not interrupted by command frames addressed to other devices.

If desired, you may enable the automatic address recognition feature in mode 1. In this configuration, the stop bit takes the place of the ninth data bit. Bit RI is set only when the received command frame address matches the device's address and is terminated by a valid stop bit.

To support automatic address recognition, a device is identified by a given address and a broadcast address.

NOTE: The multiprocessor communication and automatic address recognition features cannot be enabled in mode 0 (i.e. setting SM2 bit in SCON register in mode 0 has no effect).

Table 16. SCON Register

SCON - Serial Control Register (98h)

7	6	5	4	3	2	1	0
FE/SM0	**SM1**	**SM2**	**REN**	**TB8**	**RB8**	**TI**	**RI**

Bit Number	Bit Mnemonic	Description
7	FE	**Framing Error bit (SMOD0=1)** Clear to reset the error state, not cleared by a valid stop bit. Set by hardware when an invalid stop bit is detected. SMOD0 must be set to enable access to the FE bit
	SM0	**Serial port Mode bit 0** Refer to SM1 for serial port mode selection. SMOD0 must be cleared to enable access to the SM0 bit
6	SM1	**Serial port Mode bit 1** SM0 SM1 Mode Description Baud Rate 0 0 0 Shift Register F_{XTAL}/12 (/6 in X2 mode) 0 1 1 8-bit UART Variable 1 0 2 9-bit UART F_{XTAL}/64 or F_{XTAL}/32 (/32, /16 in X2 mode) 1 1 3 9-bit UART Variable
5	SM2	**Serial port Mode 2 bit / Multiprocessor Communication Enable bit** Clear to disable multiprocessor communication feature. Set to enable multiprocessor communication feature in mode 2 and 3, and eventually mode 1. This bit should be cleared in mode 0.
4	REN	**Reception Enable bit** Clear to disable serial reception. Set to enable serial reception.
3	TB8	**Transmitter Bit 8 / Ninth bit to transmit in modes 2 and 3.** Clear to transmit a logic 0 in the 9th bit. Set to transmit a logic 1 in the 9th bit.
2	RB8	**Receiver Bit 8 / Ninth bit received in modes 2 and 3** Cleared by hardware if 9th bit received is a logic 0. Set by hardware if 9th bit received is a logic 1. In mode 1, if SM2 = 0, RB8 is the received stop bit. In mode 0 RB8 is not used.
1	TI	**Transmit Interrupt flag** Clear to acknowledge interrupt. Set by hardware at the end of the 8th bit time in mode 0 or at the beginning of the stop bit in the other modes.
0	RI	**Receive Interrupt flag** Clear to acknowledge interrupt. Set by hardware at the end of the 8th bit time in mode 0, see Figure 14. and Figure 15. in the other modes.

Reset Value = 0000 0000b
Bit addressable

Table 20. IP Register

IP - Interrupt Priority Register (B8h)

7	6	5	4	3	2	1	0
-	PPC	PT2	PS	PT1	PX1	PT0	PX0

Bit Number	Bit Mnemonic	Description
7	-	**Reserved** The value read from this bit is indeterminate. Do not set this bit.
6	PPC	**PCA interrupt priority bit** Refer to PPCH for priority level.
5	PT2	**Timer 2 overflow interrupt Priority bit** Refer to PT2H for priority level.
4	PS	**Serial port Priority bit** Refer to PSH for priority level.
3	PT1	**Timer 1 overflow interrupt Priority bit** Refer to PT1H for priority level.
2	PX1	**External interrupt 1 Priority bit** Refer to PX1H for priority level.
1	PT0	**Timer 0 overflow interrupt Priority bit** Refer to PT0H for priority level.
0	PX0	**External interrupt 0 Priority bit** Refer to PX0H for priority level.

Table 22. The state of ports during idle and power-down mode

Mode	Program Memory	ALE	$\overline{\text{PSEN}}$	PORT0	PORT1	PORT2	PORT3
Idle	Internal	1	1	Port Data*	Port Data	Port Data	Port Data
Idle	External	1	1	Floating	Port Data	Address	Port Data
Power Down	Internal	0	0	Port Data*	Port Data	Port Data	Port Data
Power Down	External	0	0	Floating	Port Data	Port Data	Port Data

* Port 0 can force a "zero" level. A "one" will leave port floating.

6.11. ONCE™ Mode (ON Chip Emulation)

The ONCE mode facilitates testing and debugging of systems using TS80C51Rx2 without removing the circuit from the board. The ONCE mode is invoked by driving certain pins of the TS80C51Rx2; the following sequence must be exercised:

- Pull ALE low while the device is in reset (RST high) and $\overline{PSEN}$ is high.
- Hold ALE low as RST is deactivated.

While the TS80C51Rx2 is in ONCE mode, an emulator or test CPU can be used to drive the circuit Table 26. shows the status of the port pins during ONCE mode.

Normal operation is restored when normal reset is applied.

Table 25. External Pin Status during ONCE Mode

ALE	PSEN	Port 0	Port 1	Port 2	Port 3	XTAL1/2
Weak pull-up	Weak pull-up	Float	Weak pull-up	Weak pull-up	Weak pull-up	Active

7. TS83C51RB2/RC2/RD2 ROM

7.1. ROM Structure

The TS83C51RB2/RC2/RD2 ROM memory is divided in three different arrays:

- the code array: . . . . . 16/32/64 Kbytes.
- the encryption array: . . . . . 64 bytes.
- the signature array:. . . . . 4 bytes.

7.2. ROM Lock System

The program Lock system, when programmed, protects the on-chip program against software piracy.

7.2.1. 7.2.1. Encryption Array

Within the ROM array are 64 bytes of encryption array that are initially unprogrammed (all FF's). Every time a byte is addressed during program verify, 6 address lines are used to select a byte of the encryption array. This byte is then exclusive-NOR'ed (XNOR) with the code byte, creating an encrypted verify byte. The algorithm, with the encryption array in the unprogrammed state, will return the code in its original, unmodified form.

When using the encryption array, one important factor needs to be considered. If a byte has the value FFh, verifying the byte will produce the encryption byte value. If a large block (>64 bytes) of code is left unprogrammed, a verification routine will display the content of the encryption array. For this reason all the unused code bytes should be programmed with random values. This will ensure program protection.

7.2.2. Program Lock Bits

The lock bits when programmed according to Table 28. will provide different level of protection for the on-chip code and data.

Table 28. Program Lock bits

Program Lock Bits				Protection description
Security level	**LB1**	**LB2**	**LB3**	
1	U	U	U	No program lock features enabled. Code verify will still be encrypted by the encryption array if programmed. MOVC instruction executed from external program memory returns non encrypted data.
2	P	U	U	MOVC instruction executed from external program memory are disabled from fetching code bytes from internal memory, $\overline{EA}$ is sampled and latched on reset.
3	U	P	U	Same as level 1+ Verify disable. This security level is only available for 51RDX2 devices.

U: unprogrammed
P: programmed

7.2.3. Signature bytes

The TS83C51RB2/RC2/RD2 contains 4 factory programmed signatures bytes. To read these bytes, perform the process described in section 8.3.

7.2.4. Verify Algorithm

Refer to 8.3.4.

8.3. EPROM Programming

8.3.1. Set-up modes

In order to program and verify the EPROM or to read the signature bytes, the TS87C51RB2/RC2/RD2 is placed in specific set-up modes (See Figure 18.).

Control and program signals must be held at the levels indicated in Table 30.

8.3.2. Definition of terms

Address Lines: P1.0-P1.7, P2.0-P2.5, P3.4, P3.5 respectively for A0-A15 (P2.5 (A13) for RB, P3.4 (A14) for RC, P3.5 (A15) for RD)

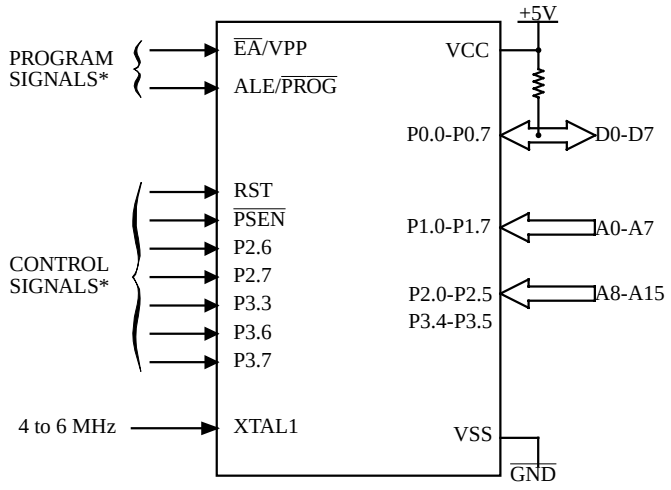
Data Lines: P0.0-P0.7 for D0-D7

Control Signals: RST, $\overline{PSEN}$, P2.6, P2.7, P3.3, P3.6, P3.7.

Program Signals: ALE/$\overline{PROG}$, $\overline{EA}$/VPP.

Table 30. EPROM Set-Up Modes

Mode	RST	PSEN	ALE/$\overline{PROG}$	$\overline{EA}$/VPP	P2.6	P2.7	P3.3	P3.6	P3.7
Program Code data	1	0	⊓	12.75V	0	1	1	1	1
Verify Code data	1	0	1	1	0	⊓	0	1	1
Program Encryption Array Address 0-3Fh	1	0	⊓	12.75V	0	1	1	0	1
Read Signature Bytes	1	0	1	1	0	⊓	0	0	0
Program Lock bit 1	1	0	⊓	12.75V	1	1	1	1	1
Program Lock bit 2	1	0	⊓	12.75V	1	1	1	0	0
Program Lock bit 3	1	0	⊓	12.75V	1	0	1	1	0



* See Table 31. for proper value on these inputs

Figure 18. Set-Up Modes Configuration

8.3.3. Programming Algorithm

The Improved Quick Pulse algorithm is based on the Quick Pulse algorithm and decreases the number of pulses applied during byte programming from 25 to 1.

To program the TS87C51RB2/RC2/RD2 the following sequence must be exercised:

- Step 1: Activate the combination of control signals.
- Step 2: Input the valid address on the address lines.
- Step 3: Input the appropriate data on the data lines.
- Step 4: Raise $\overline{EA}$/VPP from VCC to VPP (typical 12.75V).
- Step 5: Pulse ALE/$\overline{PROG}$ once.
- Step 6: Lower $\overline{EA}$/VPP from VPP to VCC

Repeat step 2 through 6 changing the address and data for the entire array or until the end of the object file is reached (See Figure 19.).

8.3.4. Verify algorithm

Code array verify must be done after each byte or block of bytes is programmed. In either case, a complete verify of the programmed array will ensure reliable programming of the TS87C51RB2/RC2/RD2.

P 2.7 is used to enable data output.

To verify the TS87C51RB2/RC2/RD2 code the following sequence must be exercised:

- Step 1: Activate the combination of program and control signals.
- Step 2: Input the valid address on the address lines.
- Step 3: Read data on the data lines.

Repeat step 2 through 3 changing the address for the entire array verification (See Figure 19.)

The encryption array cannot be directly verified. Verification of the encryption array is done by observing that the code array is well encrypted.

Symbol	Parameter	Min	Typ	Max	Unit	Test Conditions
I_{CC} operating	Power Supply Current Maximum values, X1 mode: (7)			3 + 0.6 Freq (MHz) @12MHz 10.2 @16MHz 12.6	mA	V_{CC} = 5.5 V(8)
I_{CC} idle	Power Supply Current Maximum values, X1 mode: (7)			0.25+0.3 Freq (MHz) @12MHz 3.9 @16MHz 5.1	mA	V_{CC} = 5.5 V(2)

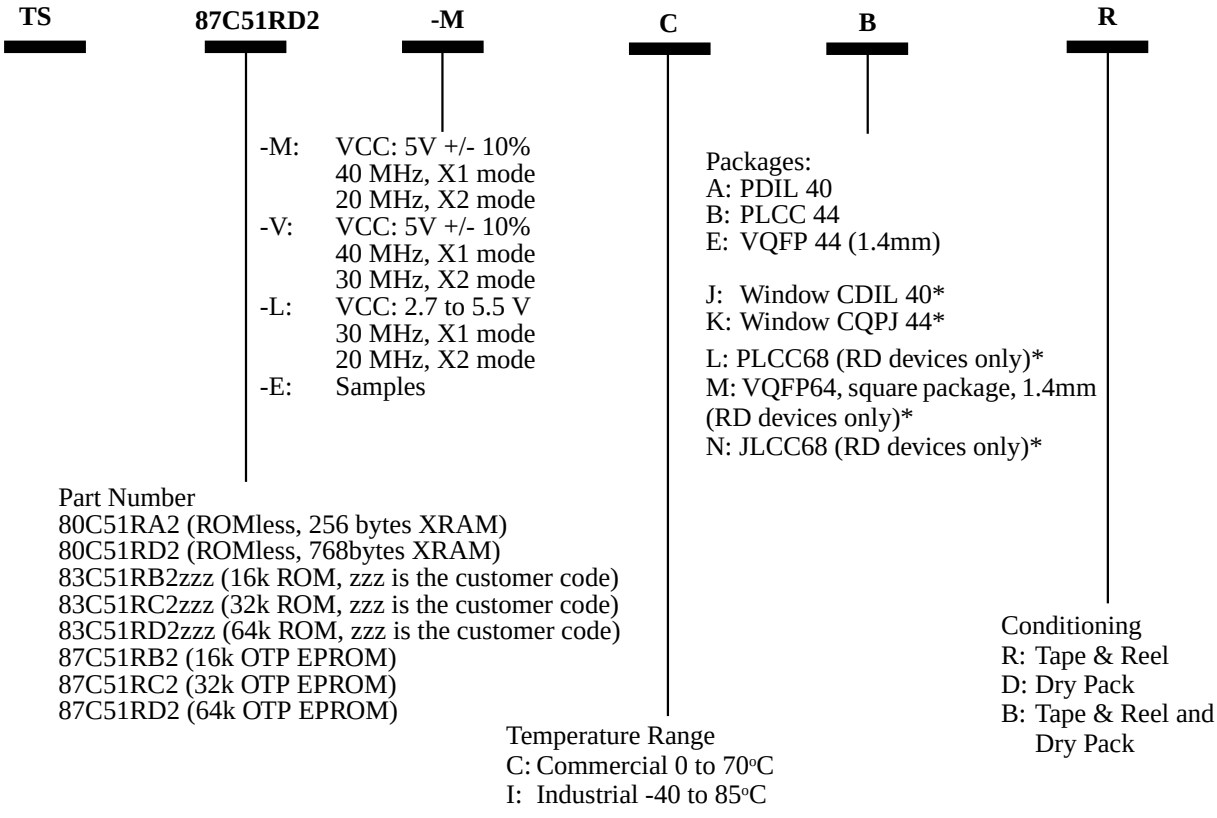
10.4. DC Parameters for Low Voltage

T_A = 0°C to +70°C; V_{SS} = 0 V; V_{CC} = 2.7 V to 5.5 V ± 10%; F = 0 to 30 MHz.
T_A = -40°C to +85°C; V_{SS} = 0 V; V_{CC} = 2.7 V to 5.5 V ± 10%; F = 0 to 30 MHz.

Table 33. DC Parameters for Low Voltage

Symbol	Parameter	Min	Typ	Max	Unit	Test Conditions
V_{IL}	Input Low Voltage	-0.5		0.2 V_{CC} - 0.1	V	
V_{IH}	Input High Voltage except XTAL1, RST	0.2 V_{CC} + 0.9		V_{CC} + 0.5	V	
V_{IH1}	Input High Voltage, XTAL1, RST	0.7 V_{CC}		V_{CC} + 0.5	V	
V_{OL}	Output Low Voltage, ports 1, 2, 3, 4, 5 (6)			0.45	V	I_{OL} = 0.8 mA(4)
V_{OL1}	Output Low Voltage, port 0, ALE, $\overline{PSEN}$ (6)			0.45	V	I_{OL} = 1.6 mA(4)
V_{OH}	Output High Voltage, ports 1, 2, 3, 4, 5	0.9 V_{CC}			V	I_{OH} = -10 µA
V_{OH1}	Output High Voltage, port 0, ALE, $\overline{PSEN}$	0.9 V_{CC}			V	I_{OH} = -40 µA
I_{IL}	Logical 0 Input Current ports 1, 2, 3, 4, 5			-50	µA	Vin = 0.45 V
I_{LI}	Input Leakage Current			±10	µA	0.45 V < Vin < V_{CC}
I_{TL}	Logical 1 to 0 Transition Current, ports 1, 2, 3, 4, 5			-650	µA	Vin = 2.0 V
R_{RST}	RST Pulldown Resistor	50	90 (5)	200	kΩ	
CIO	Capacitance of I/O Buffer			10	pF	Fc = 1 MHz T_A = 25°C
I_{PD}	Power Down Current		20 (5) 10 (5)	50 30	µA	V_{CC} = 2.0 V to 5.5 V(3) V_{CC} = 2.0 V to 3.3 V(3)
I_{CC} under RESET	Power Supply Current Maximum values, X1 mode: (7)			1 + 0.2 Freq (MHz) @12MHz 3.4 @16MHz 4.2	mA	V_{CC} = 3.3 V(1)
I_{CC} operating	Power Supply Current Maximum values, X1 mode: (7)			1 + 0.3 Freq (MHz) @12MHz 4.6 @16MHz 5.8	mA	V_{CC} = 3.3 V(8)

11. Ordering Information



(*) Check with Atmel Wireless & Microcontrollers Sales Office for availability. Ceramic packages (J, K, N) are available for proto typing, not for volume production. Ceramic packages are available for OTP only.

Table 47. Maximum Clock Frequency

Code	-M	-V	-L	Unit
Standard Mode, oscillator frequency Standard Mode, internal frequency	40 40	40 40	30 30	MHz
X2 Mode, oscillator frequency X2 Mode, internal equivalent frequency	20 40	30 **60**	20 **40**	MHz
