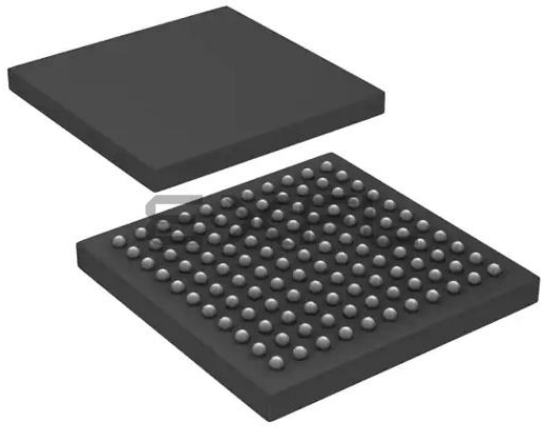
Microchip Technology - PIC32MX440F128L-80V/BG Datasheet



Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Active
Core Processor	MIPS32® M4K™
Core Size	32-Bit Single-Core
Speed	80MHz
Connectivity	I²C, IrDA, LINbus, PMP, SPI, UART/USART, USB OTG
Peripherals	Brown-out Detect/Reset, DMA, POR, PWM, WDT
Number of I/O	-
Program Memory Size	128KB (128K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	32K x 8
Voltage - Supply (Vcc/Vdd)	2.3V ~ 3.6V
Data Converters	A/D 16x10b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 105°C (TA)
Mounting Type	Surface Mount
Package / Case	121-TFBGA
Supplier Device Package	121-TFBGA (10x10)
Purchase URL	https://www.e-xfl.com/product-detail/microchip-technology/pic32mx440f128l-80v-bg

PIC32MX3XX/4XX

High-Performance, General Purpose and USB 32-bit Flash Microcontrollers

High-Performance 32-bit RISC CPU:

- MIPS32® M4K® 32-bit core with 5-stage pipeline
- 80 MHz maximum frequency
- 1.56 DMIPS/MHz (Dhrystone 2.1) performance at 0 wait state Flash access
- Single-cycle multiply and high-performance divide unit
- MIPS16e® mode for up to 40% smaller code size
- Two sets of 32 core register files (32-bit) to reduce interrupt latency
- Prefetch Cache module to speed execution from Flash

Microcontroller Features:

- Operating temperature range of -40ºC to +105ºC
- Operating voltage range of 2.3V to 3.6V
- 32K to 512K Flash memory (plus an additional 12 KB of boot Flash)
- 8K to 32K SRAM memory
- Pin-compatible with most PIC24/dsPIC® DSC devices
- Multiple power management modes
- Multiple interrupt vectors with individually programmable priority
- Fail-Safe Clock Monitor Mode
- Configurable Watchdog Timer with on-chip Low-Power RC Oscillator for reliable operation

Peripheral Features:

- Atomic SET, CLEAR and INVERT operation on select peripheral registers
- Up to 4-channel hardware DMA with automatic data size detection
- USB 2.0-compliant full-speed device and On-The-Go (OTG) controller
- USB has a dedicated DMA channel
- 3 MHz to 25 MHz crystal oscillator
- Internal 8 MHz and 32 kHz oscillators
- Separate PLLs for CPU and USB clocks
- Two I^2C™ modules
- Two UART modules with:
  - RS-232, RS-485 and LIN support
  - IrDA® with on-chip hardware encoder and decoder
- Up to two SPI modules
- Parallel Master and Slave Port (PMP/PSP) with 8-bit and 16-bit data and up to 16 address lines
- Hardware Real-Time Clock and Calendar (RTCC)
- Five 16-bit Timers/Counters (two 16-bit pairs combine to create two 32-bit timers)
- Five capture inputs
- Five compare/PWM outputs
- Five external interrupt pins
- High-Speed I/O pins capable of toggling at up to 80 MHz
- High-current sink/source (18 mA/18 mA) on all I/O pins
- Configurable open-drain output on digital I/O pins

Debug Features:

- Two programming and debugging Interfaces:
  - 2-wire interface with unintrusive access and real-time data exchange with application
  - 4-wire MIPS® standard enhanced JTAG interface
- Unintrusive hardware-based instruction trace
- IEEE Standard 1149.2-compatible (JTAG) boundary scan

Analog Features:

- Up to 16-channel 10-bit Analog-to-Digital Converter:
  - 1000 ksps conversion rate
  - Conversion available during Sleep, Idle
- Two Analog Comparators

Table of Contents

TABLE 1-1: PINOUT I/O DESCRIPTIONS (CONTINUED)

Pin Name	Pin Number(1)			Pin Type	Buffer Type	Description
	64-pin QFN/TQFP	100-pin TQFP	121-pin XBGA			
PMD0	60	93	A4	I/O	TTL/ST	Parallel Master Port Data (De-multiplexed Master mode) or Address/Data (Multiplexed Master modes).
PMD1	61	94	B4	I/O	TTL/ST	
PMD2	62	98	B3	I/O	TTL/ST	
PMD3	63	99	A2	I/O	TTL/ST	
PMD4	64	100	A1	I/O	TTL/ST	
PMD5	1	3	D3	I/O	TTL/ST	
PMD6	2	4	C1	I/O	TTL/ST	
PMD7	3	5	D2	I/O	TTL/ST	
PMD8	—	90	A5	I/O	TTL/ST	
PMD9	—	89	E6	I/O	TTL/ST	
PMD10	—	88	A6	I/O	TTL/ST	
PMD11	—	87	B6	I/O	TTL/ST	
PMD12	—	79	A9	I/O	TTL/ST	
PMD13	—	80	D8	I/O	TTL/ST	
PMD14	—	83	D7	I/O	TTL/ST	
PMD15	—	84	C7	I/O	TTL/ST	
PMRD	53	82	B8	O	—	Parallel Master Port Read Strobe.
PMWR	52	81	C8	O	—	Parallel Master Port Write Strobe.
PMALL	30	44	L8	O	—	Parallel Master Port Address Latch Enable low-byte (Multiplexed Master modes).
PMALH	29	43	K7	O	—	Parallel Master Port Address Latch Enable high-byte (Multiplexed Master modes).
VBUS	34	54	H8	I	Analog	USB Bus Power Monitor.
VUSB	35	55	H9	P	—	USB Internal Transceiver Supply. If the USB module is *not* used, this pin must be connected to VDD.
VBUSON	11	20	H1	O	—	USB Host and OTG Bus Power Control Output.
D+	37	57	H10	I/O	Analog	USB D+.
D-	36	56	J11	I/O	Analog	USB D-.
USBID	33	51	K10	I	ST	USB OTG ID Detect.
ENVREG	57	86	A7	I	ST	Enable for On-Chip Voltage Regulator.
TRCLK	—	91	C5	O	—	Trace Clock.
TRD0	—	97	A3	O	—	Trace Data Bits 0-3.
TRD1	—	96	C3	O	—	
TRD2	—	95	C4	O	—	
TRD3	—	92	B5	O	—	
PGED1	16	25	K2	I/O	ST	Data I/O pin for programming/debugging communication channel 1.
PGEC1	15	24	K1	I	ST	Clock input pin for programming/debugging communication channel 1.

Legend: CMOS = CMOS compatible input or output; Analog = Analog input; P = Power
ST = Schmitt Trigger input with CMOS levels; O = Output; I = Input
TTL = TTL input buffer

Note 1: Pin numbers are provided for reference only. See the **"Pin Diagrams"** section for device pin availability.

NOTES:

4.0 MEMORY ORGANIZATION

Note 1: This data sheet summarizes the features of the PIC32MX3XX/4XX family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 3. "Memory Organization"** (DS61115) of the *"PIC32 Family Reference Manual",* which is available from the Microchip web site (www.microchip.com/PIC32).

PIC32MX3XX/4XX microcontrollers provide 4 GB of unified virtual memory address space. All memory regions including program, data memory, SFRs and Configuration registers reside in this address space at their respective unique addresses. The program and data memories can be optionally partitioned into user and kernel memories. In addition, the data memory can be made executable, allowing PIC32MX3XX/4XX to execute from data memory.

4.1 Key Features

- 32-bit native data width
- Separate User and Kernel mode address space
- Flexible program Flash memory partitioning
- Flexible data RAM partitioning for data and program space
- Separate boot Flash memory for protected code
- Robust bus exception handling to intercept runaway code
- Simple memory mapping with Fixed Mapping Translation (FMT) unit
- Cacheable and non-cacheable address regions

4.2 PIC32MX3XX/4XX Memory Layout

PIC32MX3XX/4XX microcontrollers implement two address spaces: Virtual and Physical. All hardware resources such as program memory, data memory and peripherals are located at their respective physical addresses. Virtual addresses are exclusively used by the CPU to fetch and execute instructions as well as access peripherals. Physical addresses are used by peripherals such as DMA and Flash controller that access memory independently of CPU.

TABLE 4-8: INPUT CAPTURE1-5 REGISTERS MAP

Virtual Address (BF80_#)	Register Name	Bit Range	Bits																All Resets

Note 1: All registers in this table have corresponding CLR, SET and INV registers at their virtual addresses, plus offsets of 0x4, 0x8 and 0xC, respectively. See **Section 12.1.1 "CLR, SET and INV Registers"** for more information.

NOTES:

12.0 I/O PORTS

Note 1: This data sheet summarizes the features of the PIC32MX3XX/4XX family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 12. "I/O Ports"** (DS61120) of the *"PIC32 Family Reference Manual"*, which is available from the Microchip web site (www.microchip.com/PIC32).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

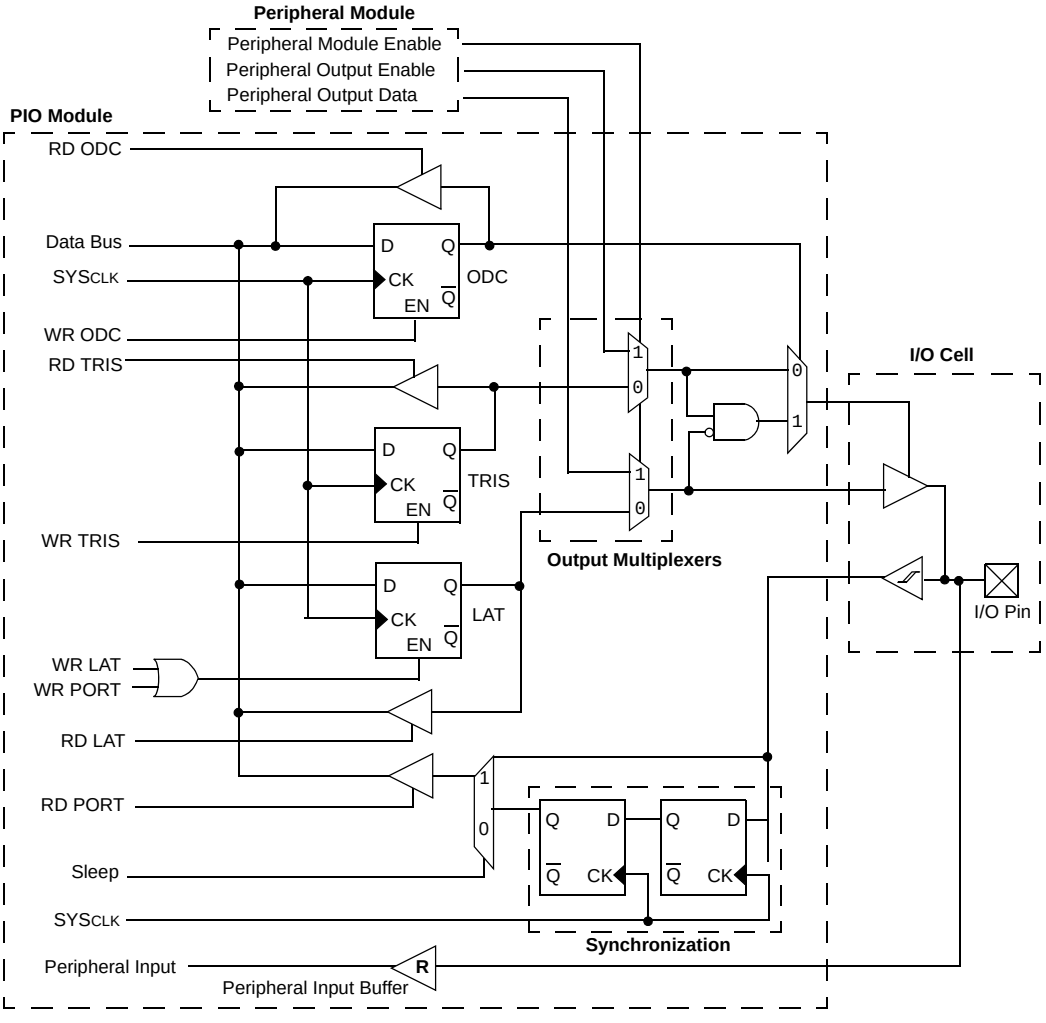
General purpose I/O pins are the simplest of peripherals. They allow the PIC® MCU to monitor and control other devices. To add flexibility and functionality, some pins are multiplexed with alternate function(s). These functions depend on which peripheral features are on the device. In general, when a peripheral is functioning, that pin may not be used as a general purpose I/O pin.

Following are some of the key features of this module:

- Individual Output Pin Open-drain Enable/Disable
- Individual Input Pin Weak Pull-up Enable/Disable
- Monitor Selective Inputs and Generate Interrupt when Change in Pin State is Detected
- Operation during CPU Sleep and Idle modes
- Fast Bit Manipulation using CLR, SET and INV Registers

Figure 12-1 illustrates a block diagram of a typical multiplexed I/O port.

FIGURE 12-1: BLOCK DIAGRAM OF A TYPICAL MULTIPLEXED PORT STRUCTURE



Legend: R = Peripheral input buffer types may vary. Refer to Table 1-1 for peripheral details.

Note: This block diagram is a general representation of a shared port/peripheral structure for illustration purposes only. The actual structure for any specific port/peripheral combination may be different than it is shown here.

NOTES:

NOTES:

19.0 UNIVERSAL ASYNCHRONOUS RECEIVER TRANSMITTER (UART)

Note 1: This data sheet summarizes the features of the PIC32MX3XX/4XX family of devices. It is not intended to be a comprehensive reference source. To complement the information in this data sheet, refer to **Section 21. "Universal Asynchronous Receiver Transmitter (UART)"** (DS61107) of the *"PIC32 Family Reference Manual"***,** which is available from the Microchip web site (www.microchip.com/PIC32).

2: Some registers and associated bits described in this section may not be available on all devices. Refer to **Section 4.0 "Memory Organization"** in this data sheet for device-specific register and bit information.

The UART module is one of the serial I/O modules available in PIC32MX3XX/4XX family devices. The UART is a full-duplex, asynchronous communication channel that communicates with peripheral devices and personal computers through protocols such as RS-232, RS-485, LIN 1.2 and IrDA®. The module also supports the hardware flow control option, with UxCTS and UxRTS pins, and also includes an IrDA encoder and decoder.

The primary features of the UART module are:

- Full-duplex, 8-bit or 9-bit data transmission
- Even, odd or no parity options (for 8-bit data)
- One or two Stop bits
- Hardware auto-baud feature
- Hardware flow control option
- Fully integrated Baud Rate Generator (BRG) with 16-bit prescaler
- Baud rates ranging from 76 bps to 20 Mbps at 80 MHz
- 4-level-deep First-In-First-Out (FIFO) Transmit Data Buffer
- 4-level-deep FIFO Receive Data Buffer
- Parity, framing and buffer overrun error detection
- Support for interrupt only on address detect (9th bit = 1)
- Separate transmit and receive interrupts
- Loopback mode for diagnostic support
- LIN protocol support
- IrDA encoder and decoder with 16x baud clock output for external IrDA encoder/decoder support

Figure 19-1 illustrates a simplified block diagram of the UART.

00110 = 1:64
00101 = 1:32
00100 = 1:16
00011 = 1:8
00010 = 1:4
00001 = 1:2
00000 = 1:1
All other combinations not shown result in operation = ‘10100’

bit 15-14 **FCKSM<1:0>:** Clock Switching and Monitor Selection Configuration bits
1x = Clock switching is disabled, Fail-Safe Clock Monitor is disabled
01 = Clock switching is enabled, Fail-Safe Clock Monitor is disabled
00 = Clock switching is enabled, Fail-Safe Clock Monitor is enabled

Note 1: Do not disable POSC (POSCMOD = 00) when using this oscillator source.

26.3 On-Chip Voltage Regulator

All PIC32MX3XX/4XX device's core and digital logic are designed to operate at a nominal 1.8V. To simplify system designs, most devices in the PIC32MX3XX/4XX incorporate an on-chip regulator providing the required core logic voltage from VDD.

The internal 1.8V regulator is controlled by the ENVREG pin. Tying this pin to VDD enables the regulator, which in turn provides power to the core. A low ESR capacitor (such as tantalum) must be connected to the VCORE/VCAP pin (Figure 26-2). This helps to maintain the stability of the regulator. The recommended value for the filer capacitor is provided in **Section 29.1 "DC Characteristics"**.

Note:	It is important that the low ESR capacitor is placed as close as possible to the VCORE/VCAP pin.

Tying the ENVREG pin to VSS disables the regulator. In this case, separate power for the core logic at a nominal 1.8V must be supplied to the device on the VCORE/VCAP pin.

Alternatively, the VCORE/VCAP and VDD pins can be tied together to operate at a lower nominal voltage. Refer to Figure 26-2 for possible configurations.

26.3.1 ON-CHIP REGULATOR AND POR

When the voltage regulator is enabled, it takes fixed delay for it to generate output. During this time, designated as TPU, code execution is disabled. TPU is applied every time the device resumes operation after any power-down, including Sleep mode.

If the regulator is disabled, a separate Power-up Timer (PWRT) is automatically enabled. The PWRT adds a fixed delay of TPWRT at device start-up. See **Section 29.0 "Electrical Characteristics"** for more information on TPU AND TPWRT.

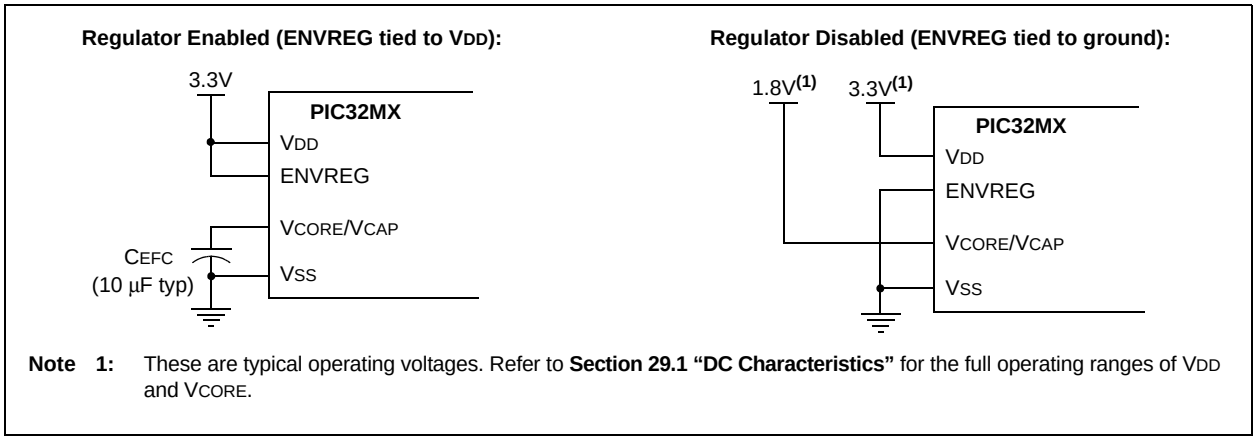
26.3.2 ON-CHIP REGULATOR AND BOR

When the on-chip regulator is enabled, PIC32MX3XX/4XX devices also have a simple brown-out capability. If the voltage supplied to the regulator is inadequate to maintain a regulated level, the regulator Reset circuitry will generate a Brown-out Reset. This event is captured by the BOR flag bit (RCON<1>). The brown-out voltage levels are specific in **Section 29.1 "DC Characteristics"**.

26.3.3 POWER-UP REQUIREMENTS

The on-chip regulator is designed to meet the power-up requirements for the device. If the application does not use the regulator, then strict power-up conditions must be adhered to. While powering up, VCORE must never exceed VDD by 0.3 volts.

FIGURE 26-2: CONNECTIONS FOR THE ON-CHIP REGULATOR



Note 1: These are typical operating voltages. Refer to **Section 29.1 "DC Characteristics"** for the full operating ranges of VDD and VCORE.
