Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Power-On Power Supply Requirements

Xilinx FPGAs require a certain amount of supply current during power-on to insure proper device initialization. The actual current consumed depends on the power-on sequence and ramp rate of the power supply.

The recommended power-on sequence for Virtex-6 devices is V_{CCINT} , V_{CCAUX} , and V_{CCO} to meet the power-up current requirements listed in [Table 5](#). V_{CCINT} can be powered up or down at any time, but power up current specifications can vary from [Table 5](#). The device will have no physical damage or reliability concerns if V_{CCINT} , V_{CCAUX} , and V_{CCO} sequence cannot be followed.

If the recommended power-up sequence cannot be followed and the I/Os must remain 3-stated throughout configuration, then V_{CCAUX} must be powered prior to V_{CCO} or V_{CCAUX} and V_{CCO} must be powered by the same supply. Similarly, for power-down, the reverse V_{CCAUX} and V_{CCO} sequence is recommended if the I/Os are to remain 3-stated.

The GTH transceiver supplies must be powered using a MGTHAVCC, MGTHAVCCR, MGTHAVCCPLL, and MGTHAVTT sequence. There are no sequencing requirement for these supplies with respect to the other FPGA supply voltages. For more detail see [Table 27: GTH Transceiver Power Supply Sequencing](#). There are no sequencing requirements for the GTX transceivers power supplies.

[Table 5](#) shows the minimum current, in addition to I_{CCQ} , that are required by Virtex-6 devices for proper power-on and configuration. If the current minimums shown in [Table 4](#) and [Table 5](#) are met, the device powers on after all three supplies have passed through their power-on reset threshold voltages. The FPGA must be configured after applying V_{CCINT} , V_{CCAUX} , and V_{CCO} for the appropriate configuration banks. Once initialized and configured, use the XPE tools to estimate current drain on these supplies.

Production Silicon and ISE Software Status

In some cases, a particular family member (and speed grade) is released to production before a speed specification is released with the correct label ([Advance](#), [Preliminary](#), [Production](#)). Any labeling discrepancies are corrected in subsequent speed specification releases.

Table 43 lists the production released Virtex-6 family member, speed grade, and the minimum corresponding supported speed specification version and ISE software revisions. The ISE® software and speed specifications listed are the minimum releases required for production. All subsequent releases of software and speed specifications are valid.

Notes:

1. TRACE will report all of these parameters as T_{RCKO_DO}.
2. T_{RCKO_DOR} includes T_{RCKO_DOW}, T_{RCKO_DOPR}, and T_{RCKO_DOPW} as well as the B port equivalent timing parameters.
3. These parameters also apply to synchronous FIFO with DO_REG = 0.
4. T_{RCKO_DO} includes T_{RCKO_DOP} as well as the B port equivalent timing parameters.
5. These parameters also apply to multirate (asynchronous) and synchronous FIFO with DO_REG = 1.
6. T_{RCKO_FLAGS} includes the following parameters: T_{RCKO_AEMPTY}, T_{RCKO_AFULL}, T_{RCKO_EMPTY}, T_{RCKO_FULL}, T_{RCKO_RDERR}, T_{RCKO_WRERR}.
7. T_{RCKO_POINTERS} includes both T_{RCKO_RDCOUNT} and T_{RCKO_WRCOUNT}.
8. The ADDR setup and hold must be met when EN is asserted (even when WE is deasserted). Otherwise, block RAM data corruption is possible.
9. T_{RCKO_DI} includes both A and B inputs as well as the parity inputs of A and B.
10. T_{RCO_FLAGS} includes the following flags: AEMPTY, AFULL, EMPTY, FULL, RDERR, WRERR, RDCOUNT, and WRCOUNT.
11. The FIFO reset must be asserted for at least three positive clock edges.
12. When using ISE software v12.4 or later, if the RDADDR_COLLISION_HWCONFIG attribute is set to PERFORMANCE or the block RAM is in single-port operation, then the faster F_{MAX} for WRITE_FIRST/NO_CHANGE modes apply.

Notes:

1. Setup and Hold times are measured over worst case conditions (process, voltage, temperature). Setup time is measured relative to the Global Clock input signal using the slowest process, highest temperature, and lowest voltage. Hold time is measured relative to the Global Clock input signal using the fastest process, lowest temperature, and highest voltage.
2. IFF = Input Flip-Flop or Latch
3. Use IBIS to determine any duty-cycle distortion incurred using various standards.

Clock Switching Characteristics

The parameters in this section provide the necessary values for calculating timing budgets for Virtex-6 FPGA clock transmitter and receiver data-valid windows.

Notes:

1. These parameters represent the worst-case duty cycle distortion observable at the pins of the device using LVDS output buffers. For cases where other I/O standards are used, IBIS can be used to calculate any additional duty cycle distortion that might be caused by asymmetrical rise/fall times.
2. The T_{CKSKEW} value represents the worst-case clock-tree skew observable between sequential I/O elements. Significantly less clock-tree skew exists for I/O registers that are close to each other and fed by the same or adjacent clock-tree branches. Use the Xilinx FPGA_Editor and Timing Analyzer tools to evaluate clock skew specific to your application.

T _{SAMP_BUFI0}	Sampling Error at Receiver Pins using BUFI0 ⁽²⁾	All	300	350	400	440	ps

Notes:

1. This parameter indicates the total sampling error of Virtex-6 FPGA DDR input registers, measured across voltage, temperature, and process. The characterization methodology uses the MMCM to capture the DDR input registers' edges of operation. These measurements include:
 - CLK0 MMCM jitter
 - MMCM accuracy (phase offset)
 - MMCM phase shift resolution
 These measurements do not include package or clock tree skew.
2. This parameter indicates the total sampling error of Virtex-6 FPGA DDR input registers, measured across voltage, temperature, and process. The characterization methodology uses the BUFI0 clock network and IODELAY to capture the DDR input registers' edges of operation. These measurements do not include package or clock tree skew.

Updated the description for $F_{IDELAYCTRL_REF}$ in Table 53 . Updated F_{MCCK} in Table 59 .
04/01/11	3.2	Added T_j values for C, E, and I temperature ranges to Table 2 . Updated the I_{CCQ} values in Table 4 . Updated F_{GCLK} in Table 34 . Designated the data sheet as Production for all devices not already labeled production in Table 42 . Changed the XC6VHX255T and XC6VHX565T devices in all packages to production status in Table 42 and Table 43 . This included updates to the Virtex-6 Device Pin-to-Pin Output Parameter Guidelines and Virtex-6 Device Pin-to-Pin Input Parameter Guidelines for these devices. Production speed specifications for these devices are available using the speed specification v1.14 in the ISE 13.1 software update. Updated and added package skew values to Table 72 ; these values are correct with regards to previous production released speed specifications in software. Updated copyright page 1 and Notice of Disclaimer .
12/08/11	3.3	Production release of the Defense-grade XQ devices in Table 42 and Table 43 using ISE v13.3 v1.17 Patch for -2 and -1 speed specifications; and v1.10 for -1L speed specifications. Added the XQ6VLX130T, XQ6VLX240T, XQ6VLX550T, XQ6VSX315T, and XQ6VSX475T to the data sheet which included adding Table 45 . Updated T_j in Table 2 . In Table 40 , updated T_j for most specifications and added Note 4 . Added Note 4 to Table 41 . Added -1(XQ) speed specification columns only to Table 50 , Table 51 , Table 52 , and Table 58 . Updated V_{OD} in Table 8 , V_{OCM} in Table 9 , and V_{OCM} and V_{DIFF} in Table 10 . Updated the Power-On Power Supply Requirements section. In Table 27 , updated maximum specification for $T_{HAVCC2HAVCCRX}$ and added Note 3 . Updated T_j in Table 40 . In Table 41 , increased the DDR LVDS receiver (SPI-4.2) -1 speed grade performance value from 1.0 Gb/s to 1.1 Gb/s. In Table 60 , updated the F_{MAX} to add a separate row for the LX760 device values. The speed specifications in the software tools have always matched these values for the LX760, the data sheet is now correct. Updated the notes for $T_{OUTJITTER}$ in Table 64 .
