Understanding [Embedded - FPGAs \(Field Programmable Gate Array\)](#)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Details

Product Status	Active
Number of LABs/CLBs	15600
Number of Logic Elements/Cells	199680
Total RAM Bits	12681216
Number of I/O	400
Number of Gates	-
Voltage - Supply	0.91V ~ 0.97V
Mounting Type	Surface Mount
Operating Temperature	-40°C ~ 100°C (TJ)
Package / Case	784-BBGA, FCBGA
Supplier Device Package	784-FCBGA (29x29)

Important Note

Typical values for quiescent supply current are specified at nominal voltage, 85°C junction temperatures (T_j). Xilinx recommends analyzing static power consumption at $T_j = 85^\circ\text{C}$ because the majority of designs operate near the high end of the commercial temperature range. Quiescent supply current is specified by speed grade for Virtex-6 devices. Use the XPower™ Estimator (XPE) spreadsheet tool (download at <http://www.xilinx.com/power>) to calculate static power consumption for conditions other than those specified in Table 4.

Notes:

1. Typical values are specified at nominal voltage, 85°C junction temperatures (T_j). -1 and -2 industrial (I) grade devices have the same typical values as commercial (C) grade devices at 85°C, but higher values at 100°C. Use the XPE tool to calculate 100°C values. -1L industrial temperature range devices have the values specified in this column.
2. Use the XPE tool to calculate 125°C values for -1M temperature range devices.
3. The -2E extended temperature range ($T_j = 0^\circ\text{C}$ to $+100^\circ\text{C}$) is only available in these devices. The -2I temperature range ($T_j = -40^\circ\text{C}$ to $+100^\circ\text{C}$) is available for all other devices except the XC6VHX565T.
4. The XC6VHX380T is available with both -2E and -2I temperature ranges.
5. The XC6VHX565T is only available in the following temperature ranges: -1C, -1I, -2C, and -2E.
6. The XQ6VLX130T, XQ6VLX240T, and XQ6VSX315T are available in -2I, -1I, -1M, and -1LI temperature ranges.
7. The XQ6VLX550T and the XQ6VSX475T are only available in -1I and -1LI temperature ranges.
8. Typical values are for blank configured devices with no output current loads, no active input pull-up resistors, all I/O pins are 3-state and floating.
9. If DCI or differential signaling is used, more accurate quiescent current estimates can be obtained by using the XPE or XPower Analyzer (XPA) tools.

SelectIO™ DC Input and Output Levels

Values for V_{IL} and V_{IH} are recommended input voltages. Values for I_{OL} and I_{OH} are guaranteed over the recommended operating conditions at the V_{OL} and V_{OH} test points. Only selected standards are tested. These are chosen to ensure that all standards meet their specifications. The selected standards are tested at a minimum V_{CCO} with the respective V_{OL} and V_{OH} voltage levels shown. Other standards are sample tested.

Notes:

- Offset errors are removed by enabling the System Monitor automatic gain calibration feature.
- See "System Monitor Timing" in [UG370: Virtex-6 FPGA System Monitor User Guide](#)
- See "Analog Inputs" in [UG370: Virtex-6 FPGA System Monitor User Guide](#) for a detailed description.
- These internal references are not specified over the junction temperature operating range for military (M) temperature devices.
- Any variation in the reference voltage from the nominal $V_{\text{REFP}} = 1.25\text{V}$ and $V_{\text{REFN}} = 0\text{V}$ will result in a deviation from the ideal transfer function. This also impacts the accuracy of the internal sensor measurements (i.e., temperature and power supply). However, for external ratio metric type applications allowing reference to vary by $\pm 4\%$ is permitted.

Performance Characteristics

This section provides the performance characteristics of some common functions and designs implemented in Virtex-6 devices. The numbers reported here are worst-case values; they have all been fully characterized. These values are subject to the same guidelines as the [Switching Characteristics, page 26](#).

RLDRAM II	500 MHz	400 MHz	350 MHz	–

Notes:

1. LVDS receivers are typically bounded with certain applications where specific DPA algorithms dominate deterministic performance.
2. Verified on Xilinx memory characterization platforms designed according to the guidelines in UG: *Virtex-6 FPGA Memory Interface Solutions User Guide*.
3. Consult [DS186: Virtex-6 FPGA Memory Interface Solutions Data Sheet](#) for performance and feature information on memory interface cores (controller plus PHY).
4. Memory Interface data rates have not been tested over the junction temperature operating range for military (M) temperature devices. Customers are responsible for specifying and testing their specific M temperature grade memory implementation.

Notes:

1. The input delay measurement methodology parameters for LVDCI are the same for LVCMOS standards of the same voltage. Input delay measurement methodology parameters for HSLVDCI are the same as for HSTL_II standards of the same voltage. Parameters for all other DCI standards are the same for the corresponding non-DCI standards.
2. Input waveform switches between V_L and V_H .
3. Measurements are made at typical, minimum, and maximum V_{REF} values. Reported delays reflect worst case of these measurements. V_{REF} values listed are typical.
4. Input voltage level from which measurement starts.
5. This is an input voltage reference that bears no relation to the V_{REF} / V_{MEAS} parameters found in IBIS models and/or noted in [Figure 6](#).
6. The value given is the differential input voltage.

Output Delay Measurements

Output delays are measured using a Tektronix P6245 TDS500/600 probe (< 1 pF) across approximately 4" of FR4 microstrip trace. Standard termination was used for all testing. The propagation delay of the 4" trace is characterized separately and subtracted from the final measurement, and is therefore not included in the generalized test setups shown in [Figure 6](#) and [Figure 7](#).

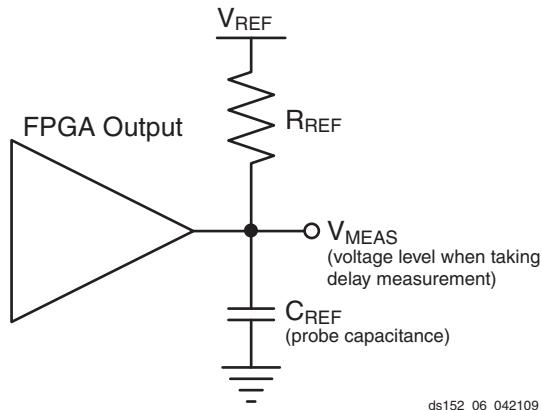

Figure 6: Single Ended Test Setup

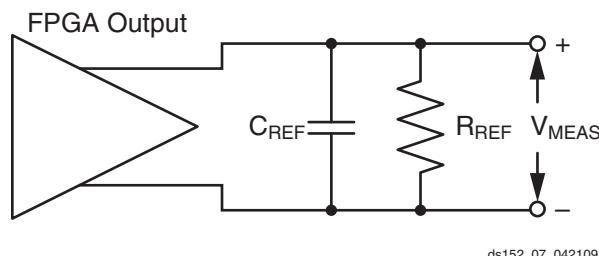

Figure 7: Differential Test Setup

Measurements and test conditions are reflected in the IBIS models except where the IBIS format precludes it. Parameters V_{REF} , R_{REF} , C_{REF} , and V_{MEAS} fully describe the test conditions for each I/O standard. The most accurate prediction of propagation delay in any given application can be obtained through IBIS simulation, using the following method:

1. Simulate the output driver of choice into the generalized test setup, using values from [Table 48](#).
2. Record the time to V_{MEAS} .
3. Simulate the output driver of choice into the actual PCB trace and load, using the appropriate IBIS model or capacitance value to represent the load.
4. Record the time to V_{MEAS} .
5. Compare the results of steps 2 and 4. The increase or decrease in delay yields the actual propagation delay of the PCB trace.

Notes:

- Setup and Hold times are measured over worst case conditions (process, voltage, temperature). Setup time is measured relative to the Global Clock input signal using the slowest process, highest temperature, and lowest voltage. Hold time is measured relative to the Global Clock input signal using the fastest process, lowest temperature, and highest voltage.
- IFF = Input Flip-Flop or Latch
- A Zero "0" Hold Time listing indicates no hold time or a negative hold time. Negative values can not be guaranteed "best-case", but if a "0" is listed, there is no positive hold time.

Notes:

- These values represent the worst-case skew between any two SelectIO resources in the package: shortest flight time to longest flight time from Pad to Ball (7.0 ps per mm).
- Package trace length information is available for these device/package combinations. This information can be used to deskew the package.

Table 73: Sample Window

Symbol	Description	Device	Speed Grade				Units
			-3	-2	-1	-1L	
T _{SAMP}	Sampling Error at Receiver Pins ⁽¹⁾	All	510	560	610	670	ps
T _{SAMP_BUFI0}	Sampling Error at Receiver Pins using BUFI0 ⁽²⁾	All	300	350	400	440	ps

Notes:

1. This parameter indicates the total sampling error of Virtex-6 FPGA DDR input registers, measured across voltage, temperature, and process. The characterization methodology uses the MMCM to capture the DDR input registers' edges of operation. These measurements include:
 - CLK0 MMCM jitter
 - MMCM accuracy (phase offset)
 - MMCM phase shift resolution
 These measurements do not include package or clock tree skew.
2. This parameter indicates the total sampling error of Virtex-6 FPGA DDR input registers, measured across voltage, temperature, and process. The characterization methodology uses the BUFI0 clock network and IODELAY to capture the DDR input registers' edges of operation. These measurements do not include package or clock tree skew.

Revision History

The following table shows the revision history for this document:

Date	Version	Description of Revisions
06/24/09	1.0	Initial Xilinx release.
07/16/09	1.1	Revised the maximum V _{CCAUX} and V _{IN} numbers in Table 2, page 2 . Removed empty column from Table 3, page 3 . Revised specifications on Table 20, page 13 . Updated Table 38, page 22 and added notes 1 and 2. Revised T _{DLYCCO_RDY} , T _{IDELAYCTRL_RPW} , and T _{IDELAYPAT_JIT} in Table 53, page 41 . Updated Table 58, page 46 to more closely match the DSP48E1 speed specifications. Updated T _{TAPTCK/TCKTAP} in Table 59, page 49 . Updated XC6VLX130T parameters in Table 68 through Table 70, page 59 .
08/19/09	1.2	Added values for -1L voltages and speed grade in all pertinent tables. Added V _{FS} and notes to Table 1 and Table 2 . Removed DV _{PPIN} from the example in Figure 2 . Added networking applications to Table 41, page 25 . Changed and added to the block RAM F _{MAX} section in Table 57, page 44 including removing Note 12. Changed F _{PFDMAX} values and corrected units for T _{STATPHAOFFSET} and T _{OUTDUTY} in Table 64, page 52 . Updated Table 71, page 60 .
09/16/09	2.0	Added Virtex-6 HXT devices to entire document including GTH Transceiver Specifications . Updated speed specifications as described in Switching Characteristics , includes changes in Table 51 , Table 57 , Table 58 , and Table 66 through Table 70 . Comprehensive changes to Table 14 , Table 15 , and Table 16 . Added conditions to DV _{PPOUT} and revised description of T _{OSKEW} in Table 17 . Removed V _{ISE} specification and note from Table 18 . Added note 3 to Table 23 . Updated note 3 in Table 24 . Updated LVCMOS25 delays in Table 44 . Updated specification for T _{IOTPHZ} in Table 46 . Removed T _{BUFHSKREW} from Table 71, page 60 and added values for T _{BUFIOSKEW} . Added values in Table 74 .
