Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

Power-On Power Supply Requirements

Xilinx FPGAs require a certain amount of supply current during power-on to insure proper device initialization. The actual current consumed depends on the power-on sequence and ramp rate of the power supply.

The recommended power-on sequence for Virtex-6 devices is V_{CCINT} , V_{CCAUX} , and V_{CCO} to meet the power-up current requirements listed in Table 5. V_{CCINT} can be powered up or down at any time, but power up current specifications can vary from Table 5. The device will have no physical damage or reliability concerns if V_{CCINT} , V_{CCAUX} , and V_{CCO} sequence cannot be followed.

If the recommended power-up sequence cannot be followed and the I/Os must remain 3-stated throughout configuration, then V_{CCAUX} must be powered prior to V_{CCO} or V_{CCAUX} and V_{CCO} must be powered by the same supply. Similarly, for power-down, the reverse V_{CCAUX} and V_{CCO} sequence is recommended if the I/Os are to remain 3-stated.

The GTH transceiver supplies must be powered using a MGTHAVCC, MGTHAVCCR, MGTHAVCCPLL, and MGTHAVTT sequence. There are no sequencing requirement for these supplies with respect to the other FPGA supply voltages. For more detail see Table 27: *GTH Transceiver Power Supply Sequencing*. There are no sequencing requirements for the GTX transceivers power supplies.

Table 5 shows the minimum current, in addition to I_{CCQ} , that are required by Virtex-6 devices for proper power-on and configuration. If the current minimums shown in Table 4 and Table 5 are met, the device powers on after all three supplies have passed through their power-on reset threshold voltages. The FPGA must be configured after applying V_{CCINT} , V_{CCAUX} , and V_{CCO} for the appropriate configuration banks. Once initialized and configured, use the XPE tools to estimate current drain on these supplies.

IOB Pad Input/Output/3-State Switching Characteristics

Table 44 (for commercial (XC) Virtex-6 devices) and **Table 45** (for the Defense-grade (XQ) Virtex-6 devices) summarizes the values of standard-specific data input delay adjustments, output delays terminating at pads (based on standard) and 3-state delays.

T_{IOPI} is described as the delay from IOB pad through the input buffer to the I-pin of an IOB pad. The delay varies depending on the capability of the SelectIO input buffer.

T_{IOOP} is described as the delay from the O pin to the IOB pad through the output buffer of an IOB pad. The delay varies depending on the capability of the SelectIO output buffer.

T_{IOTP} is described as the delay from the T pin to the IOB pad through the output buffer of an IOB pad, when 3-state is disabled. The delay varies depending on the SelectIO capability of the output buffer.

Table 46 summarizes the value of T_{IOTPHZ} . T_{IOTPHZ} is described as the delay from the T pin to the IOB pad through the output buffer of an IOB pad, when 3-state is enabled (i.e., a high impedance state).

Notes:

- Setup and Hold times are measured over worst case conditions (process, voltage, temperature). Setup time is measured relative to the Global Clock input signal using the slowest process, highest temperature, and lowest voltage. Hold time is measured relative to the Global Clock input signal using the fastest process, lowest temperature, and highest voltage.
- IFF = Input Flip-Flop or Latch
- Use IBIS to determine any duty-cycle distortion incurred using various standards.
