What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Table 1.1 Outline of Specifications (3 / 5)

Classification	Module/Function	Description
Timers	General PWM timer (GPT/GPTa)	• 16 bits x 4 channels • Counting up or down (saw-wave), counting up and down (triangle-wave) selectable for all channels • Clock sources independently selectable for all channels • 2 input/output pins per channel • 2 output compare/input capture registers per channel • For the 2 output compare/input capture registers of each channel, 4 registers are provided as buffer registers and are capable of operating as comparison registers when buffering is not in use. • In output compare operation, buffer switching can be at peaks or troughs, enabling the generation of laterally asymmetrically PWM waveforms. • Registers for setting up frame intervals on each channel (with capability for generating interrupts on overflow or underflow) • Synchronizable operation of the several counters • Modes of synchronized operation (synchronized, or displaced by desired times for phase shifting) • Generation of dead times in PWM operation • Through combination of three counters, generation of automatic three-phase PWM waveforms incorporating dead times • Starting, clearing, and stopping counters in response to external or internal triggers • Internal trigger sources: output of the internal comparator detection, software, and compare-match • The frequency-divided system clock (ICLK) can be used as a counter clock for measuring timing of the edges of signals produced by frequency-dividing the low-speed on-chip oscillator clock signal dedicated to IWDT (to detect abnormal oscillation). • PWM delay generation can control the timing with which signals on the two PWM output pins for each channel rise and fall with an accuracy of up to 1/32 times the period of the system clock (ICLK) (only for GPTa).
	Compare match timer (CMT)	• (16 bits x 2 channels) x 2 units • Select from among four internal clock signals (PCLK/8, PCLK/32, PCLK/128, PCLK/512)
	Watchdog timer (WDT)	• 8 bits x 1 channel • Select from among eight counter-input clock signals (PCLK/4, PCLK/64, PCLK/128, PCLK/512, PCLK/2048, PCLK/8192, PCLK/32768, PCLK/131072) • Switchable between watchdog timer mode and interval timer mode
	Independent watchdog timer (IWDT)	• 14 bits x 1 channel • Counter-input clock: low-speed on-chip oscillator dedicated to IWDT
Communications	Serial communications interface (SCIb)	• 3 channels • Serial communications modes: Asynchronous, clock synchronous, and smart-card interface • Multiprocessor communications • On-chip baud rate generator allows selection of the desired bit rate • Choice of LSB-first or MSB-first transfer • Noise cancellation (only available in asynchronous mode)
	I^2C bus interface (RIIC)	• 1 channel • Communications formats I^2C bus format/SMBus format Master/slave selectable

Note: • In this, the I/O port related registers (0008 C001h to 0008 C116h) indicate the bit configuration of the 112-pin LQFP version. As the configuration of registers and bits differs depending on a package, see section 14, I/O Ports, for details in the User's manual: Hardware.

Note 1. This shows the bit configuration when ADDPR.DPSEL = 0 and ADDPR.DPPRC = 0 (The value has 10-bit accuracy and is padded at the LSB end).

Note 2. This shows the bit configuration when ADCER.ADRFMT = 0 (aligned to the LSB end) and ADCER.ADPRC[1:0] = 00b. For details, refer to section 28, 12-Bit A/D Converter (S12ADA) in the User's manual: Hardware.

Note 3. This function is not supported by the product without the CAN function.

Ta = Topr. Ta is the same under conditions 1 to 3.

Item	Symbol	Min.	Typ.	Max.	Unit	Test Conditions
Rewrite/erase cycle*1	N_{DPEC}	30000	—	—	Times	
Data hold time	t_{DDRP}	30*2	—	—	Year	Ta = +85C°

Note 1. Definition of rewrite/erase cycle:
The rewrite/erase cycle is the number of erasing for each block. When the rewrite/erase cycle is n times (n = 30000), erasing can be performed n times for each block. For instance, when 128-byte writing is performed 16 times for different addresses in 2-Kbyte block and then the entire block is erased, the rewrite/erase cycle is counted as one. However, writing to the same address for several times as one erasing is not enabled (overwriting is prohibited).

Note 2. The value is obtained from the reliability test.
