#### What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

### (9) Accumulator (ACC)

The accumulator (ACC) is a 64-bit register used for DSP instructions. The accumulator is also used for the multiply and multiply-and-accumulate instructions; EMUL, EMULU, FMUL, MUL, and RMPA, in which case the prior value in the accumulator is modified by execution of the instruction.

Use the MVTACHI and MVTACLO instructions for writing to the accumulator. The MVTACHI and MVTACLO instructions write data to the higher-order 32 bits (bits 63 to 32) and the lower-order 32 bits (bits 31 to 0), respectively.

Use the MVFACHI and MVFACMI instructions for reading data from the accumulator. The MVFACHI and MVFACMI instructions read data from the higher-order 32 bits (bits 63 to 32) and the middle 32 bits (bits 47 to 16), respectively.

<b>Address</b>	<b>Module Abbreviation</b>	<b>Register Name</b>	<b>Register Abbreviation</b>	<b>Number of Bits</b>	<b>Access Size</b>	<b>Number of Access Cycles</b>
007F FFBAh	FLASH	FCU command register	FCMDR	16	16	2, 3 PCLK <sup>*3</sup>
007F FFC8h	FLASH	FCU processing switching register	FCPSR	16	16	2, 3 PCLK <sup>*3</sup>
007F FFCAh	FLASH	Data flash blank check control register	DFLBCCNT	16	16	2, 3 PCLK <sup>*3</sup>

007F FFE8h	FLASH	Peripheral clock notification register	PCKAR	16	16	2, 3 PCLK <sup>*3</sup>

Note 1. This register is not supported by the 100-pin LQFP version.

Note 2. This register is not supported by the product without the CAN function.

Note 3. The number of access states depends on the number of divided cycles for clock synchronization (0 to 1 PCLK).

Note 4. Reading the registers takes 3 cycles of ICLK and writing to the registers takes 5 cycles of ICLK.

Rewrite/erase cycle *1	N <sub>DPEC</sub>	30000	—	—	Times	
Data hold time	t <sub>DDRP</sub>	30*2	—	—	Year	Ta = +85C°

Note 1. Definition of rewrite/erase cycle:

The rewrite/erase cycle is the number of erasing for each block. When the rewrite/erase cycle is n times (n = 30000), erasing can be performed n times for each block. For instance, when 128-byte writing is performed 16 times for different addresses in 2-Kbyte block and then the entire block is erased, the rewrite/erase cycle is counted as one. However, writing to the same address for several times as one erasing is not enabled (overwriting is prohibited).

Note 2. The value is obtained from the reliability test.
