What is "[Embedded - Microcontrollers](#)"?

"[Embedded - Microcontrollers](#)" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Details

Product Status	Not For New Designs
Core Processor	RX
Core Size	32-Bit Single-Core
Speed	100MHz
Connectivity	CANbus, I ² C, LINbus, SCI, SPI
Peripherals	DMA, LVD, POR, PWM, WDT
Number of I/O	37
Program Memory Size	256KB (256K x 8)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	16K x 8
Voltage - Supply (Vcc/Vdd)	2.7V ~ 3.6V
Data Converters	A/D 8x12b
Oscillator Type	Internal
Operating Temperature	-40°C ~ 85°C (TA)
Mounting Type	Surface Mount
Package / Case	64-LQFP
Supplier Device Package	64-LFQFP (10x10)

Table 1.1 Outline of Specifications (4 / 5)

Classification	Module/Function	Description
Communications	CAN module (CAN) (as an optional function)	• 1 channel • 32 mailboxes
	Serial peripheral interface (RSPI)	• 1 unit • RSPI transfer facility Using the MOSI (master out, slave in), MISO (master in, slave out), SSL (slave select), and RSPI clock (RSPCK) signals enables serial transfer through SPI operation (four lines) or clock-synchronous operation (three lines) Capable of handling serial transfer as a master or slave • Data formats Switching between MSB first and LSB first The number of bits in each transfer can be changed to any number of bits from 8 to 16, or to 20, 24, or 32 bits. 128-bit buffers for transmission and reception Up to four frames can be transmitted or received in a single transfer operation (with each frame having up to 32 bits) • Buffered structure • Double buffers for both transmission and reception
	LIN module (LIN)	• 1 channel (LIN master) • Supports revisions 1.3, 2.0, and 2.1 of the LIN protocol
A/D converter	12-bit A/D converter (S12ADA)	• 12 bits (2 units x 4 channels) • 12-bit resolution • Conversion time: 1.0 μs per channel (in operation with A/D conversion clock ADCLK at 50 MHz) for AVCC = 4.0 to 5.5 V 2.0 μs per channel (in operation with A/D conversion clock ADCLK at 25 MHz) for AVCC0 = 3.0 to 3.6 V • Two basic operating modes Single mode and scan mode • Scan mode One-cycle scan mode Continuous scan mode 2-channel scan mode (Input ports of the A/D unit are divided into two groups in this mode, and the activation sources are separately selectable for each group.) • Sample-and-hold function A common sample-and-hold circuit for both units is included. Additionally, sample-and-hold circuit for each unit is included. (three channels per unit) • A/D-conversion register settings for each input pin. • Two registers for the result of conversion are provided for a single analog input pin of each unit (AN000 and AN100). • Three ways to start A/D conversion Conversion can be started by software, a conversion start trigger from a timer (MTU3 or GPT), or an external trigger signal. • Functionality for 8- or 10-bit precision output Right-shifting of the results of conversion for output by two or four bits is selectable. • Self-diagnostic function The self-diagnostic function internally generates three analog input voltages (VREFL0, VREFH0 x 1/2, VREFH0). • Amplification of input signals by a programmable gain amplifier (three channels per unit) Amplification rate: 2.0-, 2.5-, 3.077-, 3.636-, 4.0-, 4.444-, 5.0-, 5.714-, 6.667-, 10.0-, or 13.333-times amplification (a total of 11 steps) • Window comparators (three channels per unit)

General Precautions in the Handling of MPU/MCU Products

The following usage notes are applicable to all MPU/MCU products from Renesas. For detailed usage notes on the products covered by this document, refer to the relevant sections of the document as well as any technical updates that have been issued for the products.

1. Handling of Unused Pins

Handle unused pins in accordance with the directions given under Handling of Unused Pins in the manual.

- The input pins of CMOS products are generally in the high-impedance state. In operation with an unused pin in the open-circuit state, extra electromagnetic noise is induced in the vicinity of LSI, an associated shoot-through current flows internally, and malfunctions occur due to the false recognition of the pin state as an input signal become possible. Unused pins should be handled as described under Handling of Unused Pins in the manual.

2. Processing at Power-on

The state of the product is undefined at the moment when power is supplied.

- The states of internal circuits in the LSI are indeterminate and the states of register settings and pins are undefined at the moment when power is supplied.
In a finished product where the reset signal is applied to the external reset pin, the states of pins are not guaranteed from the moment when power is supplied until the reset process is completed. In a similar way, the states of pins in a product that is reset by an on-chip power-on reset function are not guaranteed from the moment when power is supplied until the power reaches the level at which resetting has been specified.

3. Prohibition of Access to Reserved Addresses

Access to reserved addresses is prohibited.

- The reserved addresses are provided for the possible future expansion of functions. Do not access these addresses; the correct operation of LSI is not guaranteed if they are accessed.

4. Clock Signals

After applying a reset, only release the reset line after the operating clock signal has become stable. When switching the clock signal during program execution, wait until the target clock signal has stabilized.

- When the clock signal is generated with an external resonator (or from an external oscillator) during a reset, ensure that the reset line is only released after full stabilization of the clock signal. Moreover, when switching to a clock signal produced with an external resonator (or by an external oscillator) while program execution is in progress, wait until the target clock signal is stable.

5. Differences between Products

Before changing from one product to another, i.e. to a product with a different part number, confirm that the change will not lead to problems.

- The characteristics of an MPU or MCU in the same group but having a different part number may differ in terms of the internal memory capacity, layout pattern, and other factors, which can affect the ranges of electrical characteristics, such as characteristic values, operating margins, immunity to noise, and amount of radiated noise. When changing to a product with a different part number, implement a system-evaluation test for the given product.
