Welcome to E-XFL.COM

What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Applications of "Embedded - Microcontrollers"

Details	
Product Status	Obsolete
Core Processor	C166
Core Size	16-Bit
Speed	25MHz
Connectivity	CANbus, EBI/EMI, SPI, SSC, UART/USART
Peripherals	POR, PWM, WDT
Number of I/O	59
Program Memory Size	64KB (64K x 8)
Program Memory Type	OTP
EEPROM Size	-
RAM Size	4K x 8
Voltage - Supply (Vcc/Vdd)	4.75V ~ 5.5V
Data Converters	A/D 8x10b
Oscillator Type	External
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	80-QFP
Supplier Device Package	PG-MQFP-80-7
Purchase URL	https://www.e-xfl.com/product-detail/infineon-technologies/c164ci8e25mdbkxqma1

16-Bit Single-Chip Microcontroller **C164CI**
C166 Family

C164CI/SI, C164CL/SL

- High Performance 16-bit CPU with 4-Stage Pipeline
  - 80 ns Instruction Cycle Time at 25 MHz CPU Clock
  - 400 ns Multiplication (16 × 16 bit), 800 ns Division (32 / 16 bit)
  - Enhanced Boolean Bit Manipulation Facilities
  - Additional Instructions to Support HLL and Operating Systems
  - Register-Based Design with Multiple Variable Register Banks
  - Single-Cycle Context Switching Support
  - 16 MBytes Total Linear Address Space for Code and Data
  - 1024 Bytes On-Chip Special Function Register Area
- 16-Priority-Level Interrupt System with 32 Sources, Sample-Rate down to 40 ns
- 8-Channel Interrupt-Driven Single-Cycle Data Transfer Facilities via Peripheral Event Controller (PEC)
- Clock Generation via on-chip PLL (factors 1:1.5/2/2.5/3/4/5), via prescaler or via direct clock input
- On-Chip Memory Modules
  - 2 KBytes On-Chip Internal RAM (IRAM)
  - 2 KBytes On-Chip Extension RAM (XRAM)
  - up to 64 KBytes On-Chip Program Mask ROM or OTP Memory
- On-Chip Peripheral Modules
  - 8-Channel 10-bit A/D Converter with Programmable Conversion Time down to 7.8 µs
  - 8-Channel General Purpose Capture/Compare Unit (CAPCOM2)
  - Capture/Compare Unit for flexible PWM Signal Generation (CAPCOM6) (3/6 Capture/Compare Channels and 1 Compare Channel)
  - Multi-Functional General Purpose Timer Unit with 3 Timers
  - Two Serial Channels (Synchronous/Asynchronous and High-Speed-Synchronous)
  - On-Chip CAN Interface (Rev. 2.0B active) with 15 Message Objects (Full CAN/Basic CAN)
  - On-Chip Real Time Clock
- Up to 4 MBytes External Address Space for Code and Data
  - Programmable External Bus Characteristics for Different Address Ranges
  - Multiplexed or Demultiplexed External Address/Data Buses with 8-Bit or 16-Bit Data Bus Width
  - Four Optional Programmable Chip-Select Signals
- Idle, Sleep, and Power Down Modes with Flexible Power Management
- Programmable Watchdog Timer and Oscillator Watchdog
- Up to 59 General Purpose I/O Lines, partly with Selectable Input Thresholds and Hysteresis

- Supported by a Large Range of Development Tools like C-Compilers, Macro-Assembler Packages, Emulators, Evaluation Boards, HLL-Debuggers, Simulators, Logic Analyzer Disassemblers, Programming Boards
- On-Chip Bootstrap Loader
- 80-Pin MQFP Package, 0.65 mm pitch

This document describes several derivatives of the C164 group. **Table 1** enumerates these derivatives and summarizes the differences. As this document refers to all of these derivatives, some descriptions may not apply to a specific product.

Table 1 C164CI Derivative Synopsis

Derivative[1)]	Program Memory	CAPCOM6	CAN Interf.	Operating Frequency
SAK-C164CI-8R[25]M SAF-C164CI-8R[25]M	64 KByte ROM	Full function	CAN1	20 MHz, [25 MHz]
SAK-C164SI-8R[25]M SAF-C164SI-8R[25]M	64 KByte ROM	Full function	---	20 MHz, [25 MHz]
SAK-C164CL-8R[25]M SAF-C164CL-8R[25]M	64 KByte ROM	Reduced fct.	CAN1	20 MHz, [25 MHz]
SAK-C164SL-8R[25]M SAF-C164SL-8R[25]M	64 KByte ROM	Reduced fct.	---	20 MHz, [25 MHz]
SAK-C164CL-6R[25]M SAF-C164CL-6R[25]M	48 KByte ROM	Reduced fct.	CAN1	20 MHz, [25 MHz]
SAK-C164SL-6R[25]M SAF-C164SL-6R[25]M	48 KByte ROM	Reduced fct.	---	20 MHz, [25 MHz]
SAK-C164CI-L[25]M SAF-C164CI-L[25]M	---	Full function	CAN1	20 MHz, [25 MHz]
SAK-C164CI-8EM SAF-C164CI-8EM	64 KByte OTP	Full function	CAN1	20 MHz

1) This Data Sheet is valid for ROM(less) devices starting with and including design step AB, and for OTP devices starting with and including design step DA.

For simplicity all versions are referred to by the term **C164CI** throughout this document.

Memory Organization

The memory space of the C164CI is configured in a Von Neumann architecture which means that code memory, data memory, registers and I/O ports are organized within the same linear address space which includes 16 MBytes. The entire memory space can be accessed bytewise or wordwise. Particular portions of the on-chip memory have additionally been made directly bitaddressable.

The C164CI incorporates 64 KBytes of on-chip OTP memory or 64/48 KBytes of on-chip mask-programmable ROM (not in the ROM-less derivative, of course) for code or constant data. The lower 32 KBytes of the on-chip ROM/OTP can be mapped either to segment 0 or segment 1.
The OTP memory can be programmed by the CPU itself (in system, e.g. during booting) or directly via an external interface (e.g. before assembly). The programming time is approx. 100 µs per word. An external programming voltage V_{PP} = 11.5 V must be supplied for this purpose (via pin $\overline{EA}/V_{PP}$).

2 KBytes of on-chip Internal RAM (IRAM) are provided as a storage for user defined variables, for the system stack, general purpose register banks and even for code. A register bank can consist of up to 16 wordwide (R0 to R15) and/or bytewide (RL0, RH0, …, RL7, RH7) so-called General Purpose Registers (GPRs).

1024 bytes (2×512 bytes) of the address space are reserved for the Special Function Register areas (SFR space and ESFR space). SFRs are wordwide registers which are used for controlling and monitoring functions of the different on-chip units. Unused SFR addresses are reserved for future members of the C166 Family.

2 KBytes of on-chip Extension RAM (XRAM) are provided to store user data, user stacks, or code. The XRAM is accessed like external memory and therefore cannot be used for the system stack or for register banks and is not bitaddressable. The XRAM permits 16-bit accesses with maximum speed.

In order to meet the needs of designs where more memory is required than is provided on chip, up to 4 MBytes of external RAM and/or ROM can be connected to the microcontroller.

Central Processing Unit (CPU)

The main core of the CPU consists of a 4-stage instruction pipeline, a 16-bit arithmetic and logic unit (ALU) and dedicated SFRs. Additional hardware has been spent for a separate multiply and divide unit, a bit-mask generator and a barrel shifter.

Based on these hardware provisions, most of the C164CI's instructions can be executed in just one machine cycle which requires 2 CPU clocks (4 TCL). For example, shift and rotate instructions are always processed during one machine cycle independent of the number of bits to be shifted. All multiple-cycle instructions have been optimized so that they can be executed very fast as well: branches in 2 cycles, a 16 × 16 bit multiplication in 5 cycles and a 32-/16-bit division in 10 cycles. Another pipeline optimization, the so-called 'Jump Cache', reduces the execution time of repeatedly performed jumps in a loop from 2 cycles to 1 cycle.

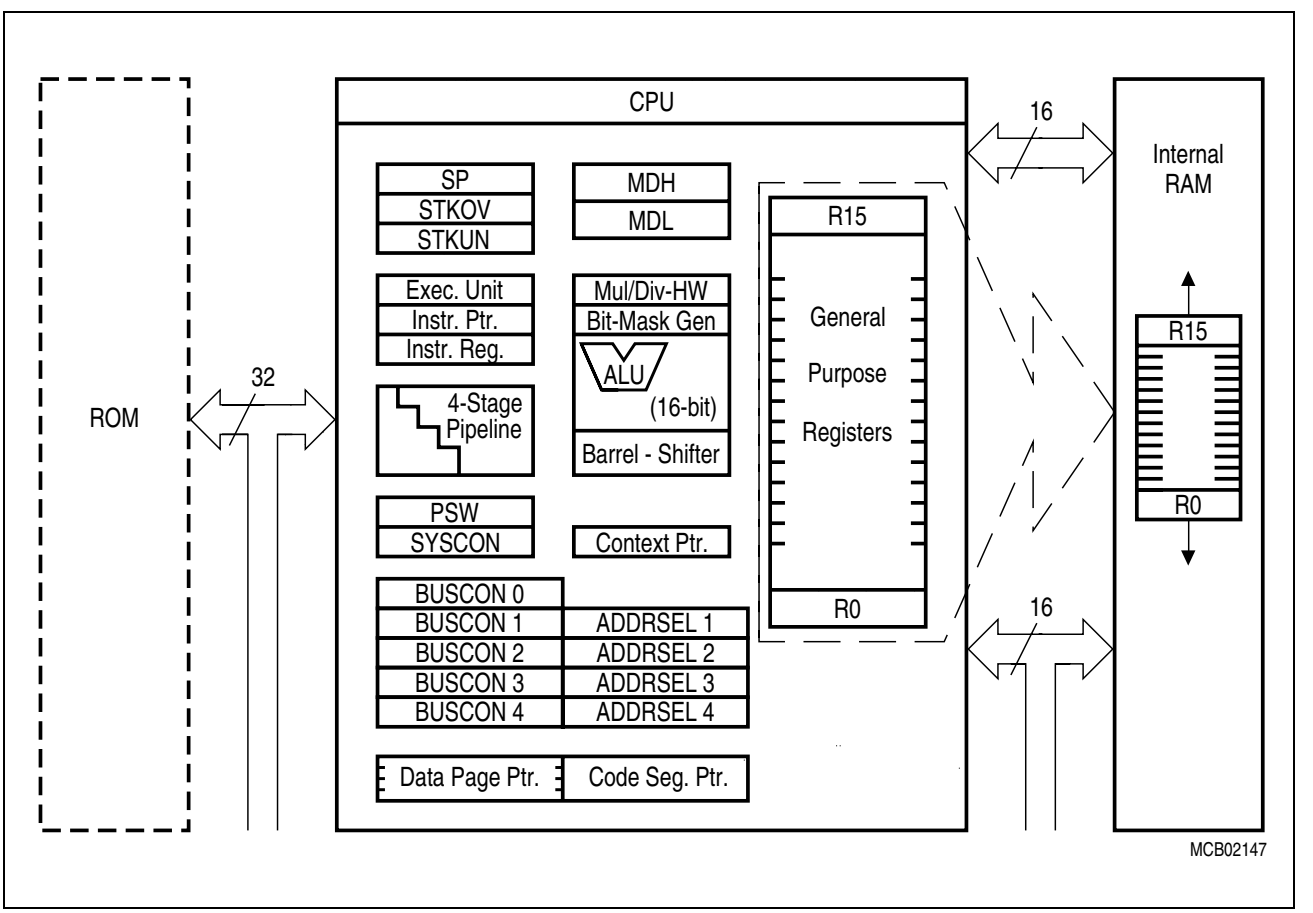

Figure 4 CPU Block Diagram

A/D Converter

For analog signal measurement, a 10-bit A/D converter with 8 multiplexed input channels and a sample and hold circuit has been integrated on-chip. It uses the method of successive approximation. The sample time (for loading the capacitors) and the conversion time is programmable and can so be adjusted to the external circuitry.

Overrun error detection/protection is provided for the conversion result register (ADDAT): either an interrupt request will be generated when the result of a previous conversion has not been read from the result register at the time the next conversion is complete, or the next conversion is suspended in such a case until the previous result has been read.

For applications which require less than 8 analog input channels, the remaining channel inputs can be used as digital input port pins.

The A/D converter of the C164CI supports four different conversion modes. In the standard Single Channel conversion mode, the analog level on a specified channel is sampled once and converted to a digital result. In the Single Channel Continuous mode, the analog level on a specified channel is repeatedly sampled and converted without software intervention. In the Auto Scan mode, the analog levels on a prespecified number of channels (standard or extension) are sequentially sampled and converted. In the Auto Scan Continuous mode, the number of prespecified channels is repeatedly sampled and converted. In addition, the conversion of a specific channel can be inserted (injected) into a running sequence without disturbing this sequence. This is called Channel Injection Mode.

The Peripheral Event Controller (PEC) may be used to automatically store the conversion results into a table in memory for later evaluation, without requiring the overhead of entering and exiting interrupt routines for each data transfer.

After each reset and also during normal operation the ADC automatically performs calibration cycles. This automatic self-calibration constantly adjusts the converter to changing operating conditions (e.g. temperature) and compensates process variations.

These calibration cycles are part of the conversion cycle, so they do not affect the normal operation of the A/D converter.

In order to decouple analog inputs from digital noise and to avoid input trigger noise those pins used for analog input can be disconnected from the digital IO or input stages under software control. This can be selected for each pin separately via register P5DIDIS (Port 5 Digital Input Disable).

CAN-Module

The integrated CAN-Module handles the completely autonomous transmission and reception of CAN frames in accordance with the CAN specification V2.0 part B (active), i.e. the on-chip CAN-Modules can receive and transmit standard frames with 11-bit identifiers as well as extended frames with 29-bit identifiers.

The module provides Full CAN functionality on up to 15 message objects. Message object 15 may be configured for Basic CAN functionality. Both modes provide separate masks for acceptance filtering which allows to accept a number of identifiers in Full CAN mode and also allows to disregard a number of identifiers in Basic CAN mode. All message objects can be updated independent from the other objects and are equipped for the maximum message length of 8 bytes.

The bit timing is derived from the XCLK and is programmable up to a data rate of 1 Mbit/s. Each CAN-Module uses two pins of Port 4 or Port 8 to interface to an external bus transceiver. The interface pins are assigned via software.

Note: When the CAN interface is assigned to Port 4, the respective segment address lines on Port 4 cannot be used. This will limit the external address space.

Watchdog Timer

The Watchdog Timer represents one of the fail-safe mechanisms which have been implemented to prevent the controller from malfunctioning for longer periods of time.

The Watchdog Timer is always enabled after a reset of the chip, and can only be disabled in the time interval until the EINIT (end of initialization) instruction has been executed. Thus, the chip's start-up procedure is always monitored. The software has to be designed to service the Watchdog Timer before it overflows. If, due to hardware or software related failures, the software fails to do so, the Watchdog Timer overflows and generates an internal hardware reset and pulls the $\overline{\text{RSTOUT}}$ pin low in order to allow external hardware components to be reset.

The Watchdog Timer is a 16-bit timer, clocked with the system clock divided by 2/4/128/256. The high byte of the Watchdog Timer register can be set to a prespecified reload value (stored in WDTREL) in order to allow further variation of the monitored time interval. Each time it is serviced by the application software, the high byte of the Watchdog Timer is reloaded. Thus, time intervals between 20 µs and 336 ms can be monitored (@ 25 MHz).
The default Watchdog Timer interval after reset is 5.24 ms (@ 25 MHz).

Oscillator Watchdog

The Oscillator Watchdog (OWD) monitors the clock signal generated by the on-chip oscillator (either with a crystal or via external clock drive). For this operation the PLL provides a clock signal which is used to supervise transitions on the oscillator clock. This PLL clock is independent from the XTAL1 clock. When the expected oscillator clock transitions are missing the OWD activates the PLL Unlock/OWD interrupt node and supplies the CPU with the PLL clock signal. Under these circumstances the PLL will oscillate with its basic frequency.

In direct drive mode the PLL base frequency is used directly (f_{CPU} = 2 … 5 MHz).
In prescaler mode the PLL base frequency is divided by 2 (f_{CPU} = 1 … 2.5 MHz).

Note: The CPU clock source is only switched back to the oscillator clock after a hardware reset.

The oscillator watchdog can be disabled by setting bit OWDDIS in register SYSCON. In this case (OWDDIS = ‘1’) the PLL remains idle and provides no clock signal, while the CPU clock signal is derived directly from the oscillator clock or via prescaler or SDD. Also no interrupt request will be generated in case of a missing oscillator clock.

Note: At the end of a reset bit OWDDIS reflects the inverted level of pin $\overline{RD}$ at that time. Thus the oscillator watchdog may also be disabled via hardware by (externally) pulling the $\overline{RD}$ line low upon a reset, similar to the standard reset configuration via PORT0.

Power Management

The C164CI provides several means to control the power it consumes either at a given time or averaged over a certain timespan. Three mechanisms can be used (partly in parallel):

- **Power Saving Modes** switch the C164CI into a special operating mode (control via instructions).
  Idle Mode stops the CPU while the peripherals can continue to operate.
  Sleep Mode and Power Down Mode stop all clock signals and all operation (RTC may optionally continue running). Sleep Mode can be terminated by external interrupt signals.
- **Clock Generation Management** controls the distribution and the frequency of internal and external clock signals (control via register SYSCON2).
  Slow Down Mode lets the C164CI run at a CPU clock frequency of f_{OSC}/1 … 32 (half for prescaler operation) which drastically reduces the consumed power. The PLL can be optionally disabled while operating in Slow Down Mode.
  External circuitry can be controlled via the programmable frequency output FOUT.
- **Peripheral Management** permits temporary disabling of peripheral modules (control via register SYSCON3).
  Each peripheral can separately be disabled/enabled. A group control option disables a major part of the peripheral set by setting one single bit.

The on-chip RTC supports intermittend operation of the C164CI by generating cyclic wakeup signals. This offers full performance to quickly react on action requests while the intermittend sleep phases greatly reduce the average power consumption of the system.

Instruction Set Summary

Table 6 lists the instructions of the C164CI in a condensed way.
The various addressing modes that can be used with a specific instruction, the operation of the instructions, parameters for conditional execution of instructions, and the opcodes for each instruction can be found in the **“C166 Family Instruction Set Manual”**.

This document also provides a detailled description of each instruction.

Table 6 Instruction Set Summary

Mnemonic	Description	Bytes
ADD(B)	Add word (byte) operands	2 / 4
ADDC(B)	Add word (byte) operands with Carry	2 / 4
SUB(B)	Subtract word (byte) operands	2 / 4
SUBC(B)	Subtract word (byte) operands with Carry	2 / 4
MUL(U)	(Un)Signed multiply direct GPR by direct GPR (16-16-bit)	2
DIV(U)	(Un)Signed divide register MDL by direct GPR (16-/16-bit)	2
DIVL(U)	(Un)Signed long divide reg. MD by direct GPR (32-/16-bit)	2
CPL(B)	Complement direct word (byte) GPR	2
NEG(B)	Negate direct word (byte) GPR	2
AND(B)	Bitwise AND, (word/byte operands)	2 / 4
OR(B)	Bitwise OR, (word/byte operands)	2 / 4
XOR(B)	Bitwise XOR, (word/byte operands)	2 / 4
BCLR	Clear direct bit	2
BSET	Set direct bit	2
BMOV(N)	Move (negated) direct bit to direct bit	4
BAND, BOR, BXOR	AND/OR/XOR direct bit with direct bit	4
BCMP	Compare direct bit to direct bit	4
BFLDH/L	Bitwise modify masked high/low byte of bit-addressable direct word memory with immediate data	4
CMP(B)	Compare word (byte) operands	2 / 4
CMPD1/2	Compare word data to GPR and decrement GPR by 1/2	2 / 4
CMPI1/2	Compare word data to GPR and increment GPR by 1/2	2 / 4
PRIOR	Determine number of shift cycles to normalize direct word GPR and store result in direct word GPR	2
SHL / SHR	Shift left/right direct word GPR	2
ROL / ROR	Rotate left/right direct word GPR	2
ASHR	Arithmetic (sign bit) shift right direct word GPR	2

Parameter Interpretation

The parameters listed in the following partly represent the characteristics of the C164CI and partly its demands on the system. To aid in interpreting the parameters right, when evaluating them for a design, they are marked in column “Symbol”:

CC (**C**ontroller **C**haracteristics):
The logic of the C164CI will provide signals with the respective characteristics.

SR (**S**ystem **R**equirement):
The external system must provide signals with the respective characteristics to the C164CI.

DC Characteristics

(Operating Conditions apply)[1)]

Parameter	Symbol		Limit Values		Unit	Test Conditions
			min.	max.		
Input low voltage (TTL, all except XTAL1)	V_{IL}	SR	-0.5	0.2 V_{DD} - 0.1	V	–
Input low voltage XTAL1	V_{IL2}	SR	-0.5	0.3 V_{DD}	V	–
Input low voltage (Special Threshold)	V_{ILS}	SR	-0.5	2.0	V	–
Input high voltage (TTL, all except $\overline{\text{RSTIN}}$, XTAL1)	V_{IH}	SR	0.2 V_{DD} + 0.9	V_{DD} + 0.5	V	–
Input high voltage $\overline{\text{RSTIN}}$ (when operated as input)	V_{IH1}	SR	0.6 V_{DD}	V_{DD} + 0.5	V	–
Input high voltage XTAL1	V_{IH2}	SR	0.7 V_{DD}	V_{DD} + 0.5	V	–
Input high voltage (Special Threshold)	V_{IHS}	SR	0.8 V_{DD} - 0.2	V_{DD} + 0.5	V	–
Input Hysteresis (Special Threshold)	HYS		400	–	mV	Series resistance = 0 Ω
Output low voltage[2)]	V_{OL}	CC	–	1.0	V	$I_{OL} \le I_{OLmax}$[3)]
			–	0.45	V	$I_{OL} \le I_{OLnom}$[3)4)]
Output high voltage[5)]	V_{OH}	CC	V_{DD} - 1.0	–	V	$I_{OH} \ge I_{OHmax}$[3)]
			V_{DD} - 0.45	–	V	$I_{OH} \ge I_{OHnom}$[3)4)]
Input leakage current (Port 5)	I_{OZ1}	CC	–	±200	nA	0 V < V_{IN} < V_{DD}

Power Consumption C164CI (OTP)

(Operating Conditions apply)

Parameter	Symbol	Limit Values		Unit	Test Conditions
		min.	max.		
Power supply current (active) with all peripherals active	I_{DD}	–	10 + 3.5 × f_{CPU}	mA	$\overline{RSTIN}$ = V_{IL} f_{CPU} in [MHz] [1]
Idle mode supply current with all peripherals active	I_{IDX}	–	5 + 1.25 × f_{CPU}	mA	$\overline{RSTIN}$ = V_{IH1} f_{CPU} in [MHz] [1]
Idle mode supply current with all peripherals deactivated, PLL off, SDD factor = 32	I_{IDO} [2]	–	500 + 50 × f_{OSC}	µA	$\overline{RSTIN}$ = V_{IH1} f_{OSC} in [MHz] [1]
Sleep and Power-down mode supply current with RTC running	I_{PDR} [2]	–	200 + 25 × f_{OSC}	µA	V_{DD} = V_{DDmax} f_{OSC} in [MHz] [3]
Sleep and Power-down mode supply current with RTC disabled	I_{PDO}	–	50	µA	V_{DD} = V_{DDmax} [3]

1) The supply current is a function of the operating frequency. This dependency is illustrated in **Figure 10**. These parameters are tested at V_{DDmax} and maximum CPU clock with all outputs disconnected and all inputs at V_{IL} or V_{IH}.

2) This parameter is determined mainly by the current consumed by the oscillator (see **Figure 8**). This current, however, is influenced by the external oscillator circuitry (crystal, capacitors). The values given refer to a typical circuitry and may change in case of a not optimized external oscillator circuitry.

3) This parameter is tested including leakage currents. All inputs (including pins configured as inputs) at 0 V to 0.1 V or at V_{DD} - 0.1 V to V_{DD}, V_{REF} = 0 V, all outputs (including pins configured as outputs) disconnected.

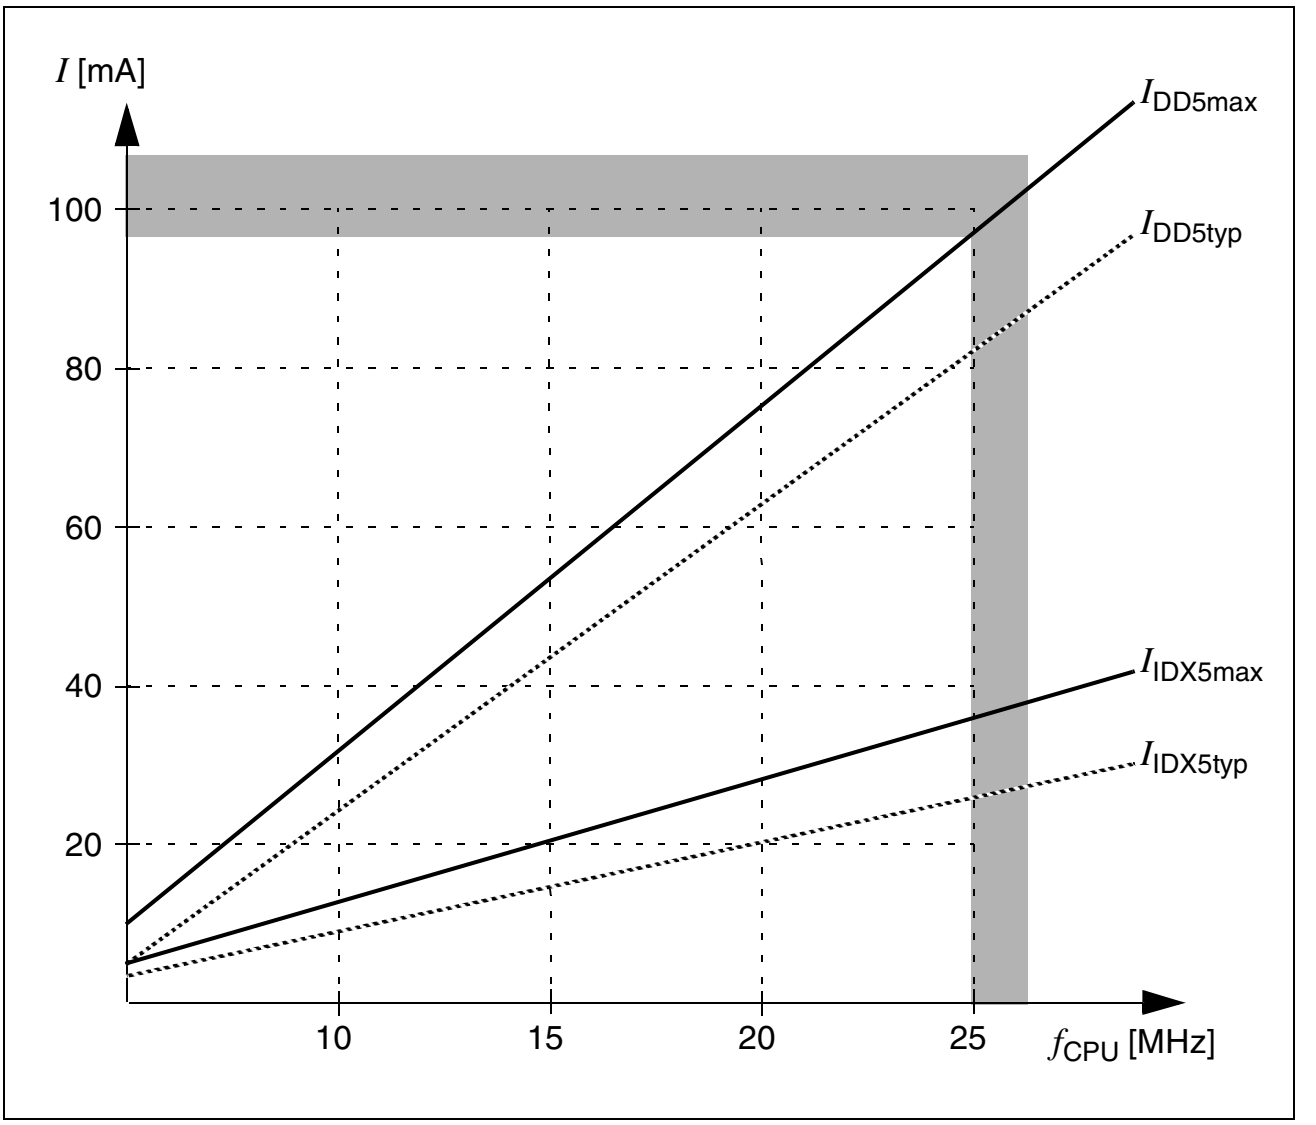

Figure 10 Supply/Idle Current as a Function of Operating Frequency for OTP Derivatives

AC Characteristics
External Clock Drive XTAL1
(Operating Conditions apply)

Table 12 External Clock Drive Characteristics

Parameter	Symbol		Direct Drive 1:1		Prescaler 2:1		PLL 1:N		Unit
			min.	max.	min.	max.	min.	max.	
Oscillator period	t_{OSC}	SR	40	–	20	–	60[1]	500[1]	ns
High time[2]	t_1	SR	20[3]	–	6	–	10	–	ns
Low time[2]	t_2	SR	20[3]	–	6	–	10	–	ns
Rise time[2]	t_3	SR	–	8	–	5	–	10	ns
Fall time[2]	t_4	SR	–	8	–	5	–	10	ns

1) The minimum and maximum oscillator periods for PLL operation depend on the selected CPU clock generation mode. Please see respective table above.

2) The clock input signal must reach the defined levels V_{IL2} and V_{IH2}.

3) The minimum high and low time refers to a duty cycle of 50%. The maximum operating freqency (f_{CPU}) in direct drive mode depends on the duty cycle of the clock input signal.

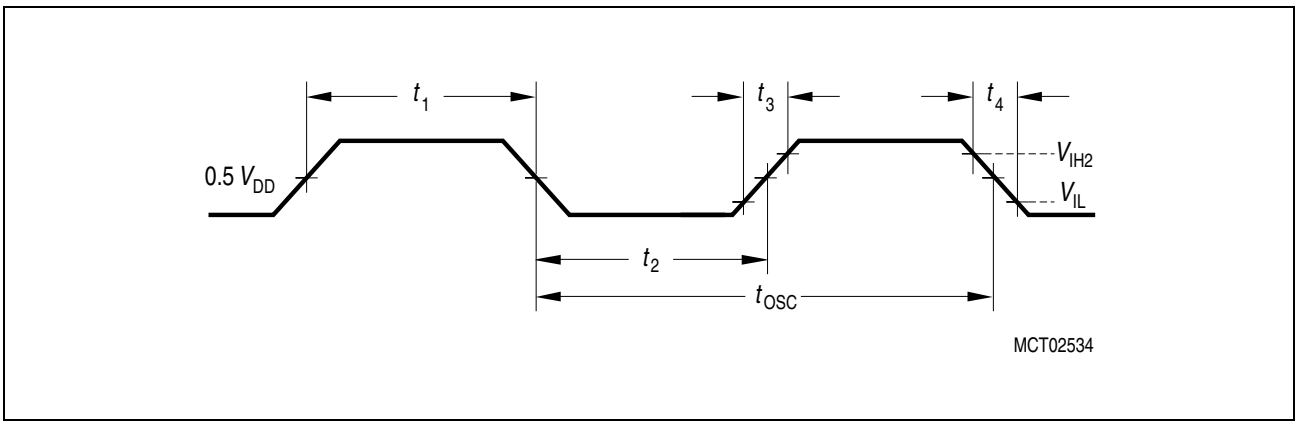

Figure 13 External Clock Drive XTAL1

Note: If the on-chip oscillator is used together with a crystal, the oscillator frequency is limited to a range of 4 MHz to 16 MHz.
It is strongly recommended to measure the oscillation allowance (or margin) in the final target system (layout) to determine the optimum parameters for the oscillator operation. Please refer to the limits specified by the crystal supplier.
When driven by an external clock signal it will accept the specified frequency range. Operation at lower input frequencies is possible but is guaranteed by design only (not 100% tested).

Multiplexed Bus (cont'd)
(Operating Conditions apply)
ALE cycle time = 6 TCL + $2t_A + t_C + t_F$ (120 ns at 25 MHz CPU clock without waitstates)
