What is "Embedded - Microcontrollers"?

"Embedded - Microcontrollers" refer to small, integrated circuits designed to perform specific tasks within larger systems. These microcontrollers are essentially compact computers on a single chip, containing a processor core, memory, and programmable input/output peripherals. They are called "embedded" because they are embedded within electronic devices to control various functions, rather than serving as standalone computers. Microcontrollers are crucial in modern electronics, providing the intelligence and control needed for a wide range of applications.

Details	
Product Status	Active
Core Processor	56800E
Core Size	16-Bit
Speed	60MHz
Connectivity	CANbus, EBI/EMI, SCI, SPI
Peripherals	POR, PWM, Temp Sensor, WDT
Number of I/O	49
Program Memory Size	256KB (128K x 16)
Program Memory Type	FLASH
EEPROM Size	-
RAM Size	10K x 16
Voltage - Supply (Vcc/Vdd)	2.25V ~ 3.6V
Data Converters	A/D 16x12b
Oscillator Type	External
Operating Temperature	-40°C ~ 125°C (TA)
Mounting Type	Surface Mount
Package / Case	128-LQFP
Supplier Device Package	128-LQFP (14x20)

Signal Name	Pin No.	Type	State During Reset	Signal Description
INDEX0 **(TA2)** **(GPOPC6)**	1	Schmitt Input Schmitt Input/ Output Schmitt Input/ Output	Input, pullup enabled	**Index** — Quadrature Decoder 0, INDEX input **TA2** — Timer A, Channel 2 **Port C GPIO** — This GPIO pin can be individually programmed as an input or output pin. After reset, the default state is INDEX0. To deactivate the internal pullup resistor, clear bit 6 of the GPIOC_PUR register.
HOME0 **(TA3)** **(GPIOC7)**	2	Schmitt Input Schmitt Input/ Output Schmitt Input/ Output	Input, pullup enabled	**Home** — Quadrature Decoder 0, HOME input **TA3** — Timer A,Channel 3 **Port C GPIO** — This GPIO pin can be individually programmed as an input or output pin. After reset, the default state is HOME0. To deactivate the internal pullup resistor, clear bit 7 of the GPIOC_PUR register.
SCLK0 **(GPIOE4)**	124	Schmitt Input/ Output Schmitt Input/ Output	Input, pullup enabled	**SPI 0 Serial Clock** — In the master mode, this pin serves as an output, clocking slaved listeners. In slave mode, this pin serves as the data clock input. **Port E GPIO** — This GPIO pin can be individually programmed as an input or output pin. After reset, the default state is SCLK0. To deactivate the internal pullup resistor, clear bit 4 in the GPIOE_PUR register.

Signal Name	Pin No.	Type	State During Reset	Signal Description
PHASEA1	9	Schmitt Input	Input, pullup enabled	**Phase A1** — Quadrature Decoder 1, PHASEA input for decoder 1.
(TB0)		Schmitt Input/ Output		**TB0** — Timer B, Channel 0
(SCLK1)		Schmitt Input/ Output		**SPI 1 Serial Clock** — In the master mode, this pin serves as an output, clocking slaved listeners. In slave mode, this pin serves as the data clock input. To activate the SPI function, set the PHSA_ALT bit in the SIM_GPS register. For details, see **Part 6.5.8**.
(GPIOC0)		Schmitt Input/ Output		**Port C GPIO** — This GPIO pin can be individually programmed as an input or output pin. In the 56F8355, the default state after reset is PHASEA1. In the 56F8155, the default state is not one of the functions offered and must be reconfigured. To deactivate the internal pullup resistor, clear bit 0 in the GPIOC_PUR register.
PHASEB1	10	Schmitt Input	Input, pullup enabled	**Phase B1** — Quadrature Decoder 1, PHASEB input for decoder 1.
(TB1)		Schmitt Input/ Output		**TB1** — Timer B, Channel 1
(MOSI1)		Schmitt Input/ Output		**SPI 1 Master Out/Slave In** — This serial data pin is an output from a master device and an input to a slave device. The master device places data on the MOSI line a half-cycle before the clock edge the slave device uses to latch the data. To activate the SPI function, set the PHSB_ALT bit in the SIM_GPS register. For details, see **Part 6.5.8**.
(GPIOC1)		Schmitt Input/ Output		**Port C GPIO** — This GPIO pin can be individually programmed as an input or output pin. In the 56F8355, the default state after reset is PHASEB1. In the 56F8155, the default state is not one of the functions offered and must be reconfigured. To deactivate the internal pullup resistor, clear bit 1 in the GPIOC_PUR register.

Part 3 On-Chip Clock Synthesis (OCCS)

3.1 Introduction

Refer to the OCCS chapter of the **56F8300 Peripheral User Manual** for a full description of the OCCS. The material contained here identifies the specific features of the OCCS design. **Figure 3-1** shows the specific OCCS block diagram to reference from the OCCS chapter of the **56F8300 Peripheral User Manual**.

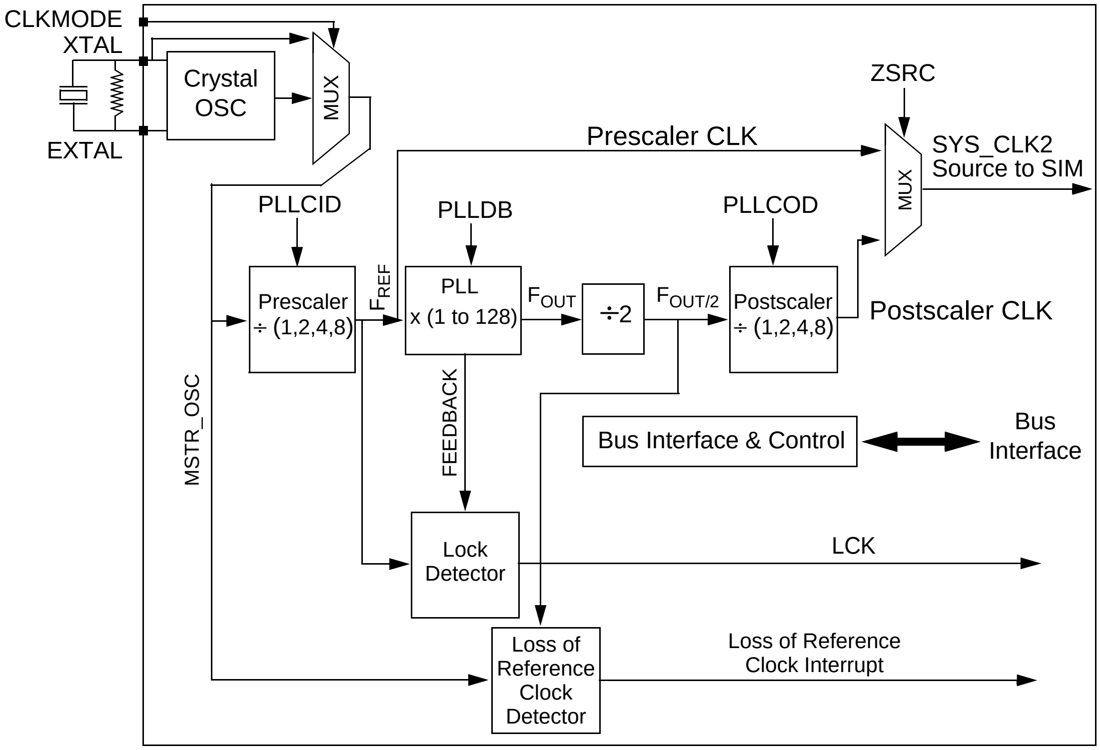

Figure 3-1 OCCS Block Diagram

3.2 External Clock Operation

The system clock can be derived from an external crystal, ceramic resonator, or an external system clock signal. To generate a reference frequency using the internal oscillator, a reference crystal or ceramic resonator must be connected between the EXTAL and XTAL pins.

3.2.1 Crystal Oscillator

The internal oscillator is designed to interface with a parallel-resonant crystal resonator in the frequency range specified for the external crystal in **Table 10-15**. A recommended crystal oscillator circuit is shown in **Figure 3-2**. Follow the crystal supplier's recommendations when selecting a crystal, since crystal parameters determine the component values required to provide maximum stability and reliable start-up.

5.3.3 Fast Interrupt Handling

Fast interrupts are described in the DSP56800E Reference Manual. The interrupt controller recognizes fast interrupts before the core does.

A fast interrupt is defined (to the ITCN) by:

1. Setting the priority of the interrupt as level 2, with the appropriate field in the IPR registers
2. Setting the FIMn register to the appropriate vector number
3. Setting the FIVALn and FIVAHn registers with the address of the code for the fast interrupt

When an interrupt occurs, its vector number is compared with the FIM0 and FIM1 register values. If a match occurs, and it is a level 2 interrupt, the ITCN handles it as a fast interrupt. The ITCN takes the vector address from the appropriate FIVALn and FIVAHn registers, instead of generating an address that is an offset from the VBA.

The core then fetches the instruction from the indicated vector adddress and if it is not a JSR, the core starts its fast interrupt handling.

It is disabled by default.

6.5.6 SIM Pullup Disable Register (SIM_PUDR)

Most of the pins on the chip have on-chip pullup resistors. Pins which can operate as GPIO can have these resistors disabled via the GPIO function. Non-GPIO pins can have their pullups disabled by setting the appropriate bit in this register. Disabling pullups is done on a peripheral-by-peripheral basis (for pins not muxed with GPIO). Each bit in the register (see **Figure 6-8**) corresponds to a functional group of pins. See

Table 2-2 to identify which pins can deactivate the internal pullup resistor.

6.5.6.1 Reserved—Bit 15

This bit field is reserved or not implemented. It is read as 0 and cannot be modified by writing.

6.5.6.2 PWMA1—Bit 14

This bit controls the pullup resistors on the FAULTA3 pin.

6.5.6.3 CAN—Bit 13

This bit controls the pullup resistors on the CAN_RX pin.

6.5.6.4 EMI_MODE—Bit 12

This bit controls the pullup resistors on the EMI_MODE pin

Note: In this package, this input pin is double-bonded with the adjacent V_{SS} pin and this bit should be changed to a 1 in order to reduce power consumption.

6.5.6.5 $\overline{\text{RESET}}$—Bit 11

This bit controls the pullup resistors on the $\overline{\text{RESET}}$ pin.

6.5.6.6 IRQ—Bit 10

This bit controls the pullup resistors on the $\overline{\text{IRQA}}$ and $\overline{\text{IRQB}}$ pins.

6.5.6.7 XBOOT—Bit 9

This bit controls the pullup resistors on the EXTBOOT pin.

Note: In this package, this input pin is double-bonded with the adjacent V_{SS} pin and this bit should be changed to a 1 in order to reduce power consumption.

6.5.6.8 PWMB—Bit 8

This bit controls the pullup resistors on the FAULTB0, FAULTB1, FAULTB2, and FAULTB3 pins.

6.5.6.9 PWMA0—Bit 7

This bit controls the pullup resistors on the FAULTA0, FAULTA1, and FAULTA2 pins.

of security. When Flash security mode is enabled in accordance with the method described in the Flash Memory module specification, the device will disable the core EOnCE debug capabilities. Normal program execution is otherwise unaffected.

7.2 Flash Access Blocking Mechanisms

The 56F8355/56F8155 have several operating functional and test modes. Effective Flash security must address operating mode selection and anticipate modes in which the on-chip Flash can be compromised and read without explicit user permission. Methods to block these are outlined in the next subsections.

7.2.1 Forced Operating Mode Selection

At boot time, the SIM determines in which functional modes the device will operate. These are:

- Unsecured Mode
- Secure Mode (EOnCE disabled)

When Flash security is enabled as described in the Flash Memory module specification, the device will disable the EOnCE debug interface.

7.2.2 Disabling EOnCE Access

On-chip Flash can be read by issuing commands across the EOnCE port, which is the debug interface for the 56800E core. The $\overline{\text{TRST}}$, TCLK, TMS, TDO, and TDI pins comprise a JTAG interface onto which the EOnCE port functionality is mapped. When the device boots, the chip-level JTAG TAP (Test Access Port) is active and provides the chip’s boundary scan capability and access to the ID register.

Proper implementation of Flash security requires that no access to the EOnCE port is provided when security is enabled. The 56800E core has an input which disables reading of internal memory via the JTAG/EOnCE. The FM sets this input at reset to a value determined by the contents of the FM security bytes.

7.2.3 Flash Lockout Recovery

If a user inadvertently enables Flash security on the device, a built-in lockout recovery mechanism can be used to reenable access to the device. This mechanism completely reases all on-chip Flash, thus disabling Flash security. Access to this recovery mechanism is built into CodeWarrior via an instruction in memory configuration (*.cfg*) files. Add, or uncomment the following configuration command:

unlock_flash_on_connect 1

For more information, please see **CodeWarrior MC56F83xx/DSP5685x Family Targeting Manual**.

The LOCKOUT_RECOVERY instruction has an associated 7-bit Data Register (DR) that is used to control the clock divider circuit within the FM module. This divider, FM_CLKDIV[6:0], is used to control the period of the clock used for timed events in the FM erase algorithm. This register must be set with appropriate values before the lockout sequence can begin. Refer to the JTAG section of the **56F8300 Peripheral User Manual** for more details on setting this register value.

Ψ_{JT} = Thermal characterization parameter (^{o}C)/W
P_D = Power dissipation in package (W)

The thermal characterization parameter is measured per JESD51-2 specification using a 40-gauge type T thermocouple epoxied to the top center of the package case. The thermocouple should be positioned so that the thermocouple junction rests on the package. A small amount of epoxy is placed over the thermocouple junction and over about 1mm of wire extending from the junction. The thermocouple wire is placed flat against the package case to avoid measurement errors caused by cooling effects of the thermocouple wire.

When heat sink is used, the junction temperature is determined from a thermocouple inserted at the interface between the case of the package and the interface material. A clearance slot or hole is normally required in the heat sink. Minimizing the size of the clearance is important to minimize the change in thermal performance caused by removing part of the thermal interface to the heat sink. Because of the experimental difficulties with this technique, many engineers measure the heat sink temperature and then back-calculate the case temperature using a separate measurement of the thermal resistance of the interface. From this case temperature, the junction temperature is determined from the junction-to-case thermal resistance.

12.2 Electrical Design Considerations

CAUTION

This device contains protective circuitry to guard against damage due to high static voltage or electrical fields. However, normal precautions are advised to avoid application of any voltages higher than maximum-rated voltages to this high-impedance circuit. Reliability of operation is enhanced if unused inputs are tied to an appropriate voltage level.

Use the following list of considerations to assure correct operation:

- Provide a low-impedance path from the board power supply to each V_{DD} pin on the device, and from the board ground to each V_{SS} (GND) pin
- The minimum bypass requirement is to place six 0.01–0.1µF capacitors positioned as close as possible to the package supply pins. The recommended bypass configuration is to place one bypass capacitor on each of the V_{DD}/V_{SS} pairs, including $V_{DDA}/V_{SSA.}$ Ceramic and tantalum capacitors tend to provide better performance tolerances.
- Ensure that capacitor leads and associated printed circuit traces that connect to the chip V_{DD} and V_{SS} (GND) pins are less than 0.5 inch per capacitor lead
- Use at least a four-layer Printed Circuit Board (PCB) with two inner layers for V_{DD} and V_{SS}
