Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

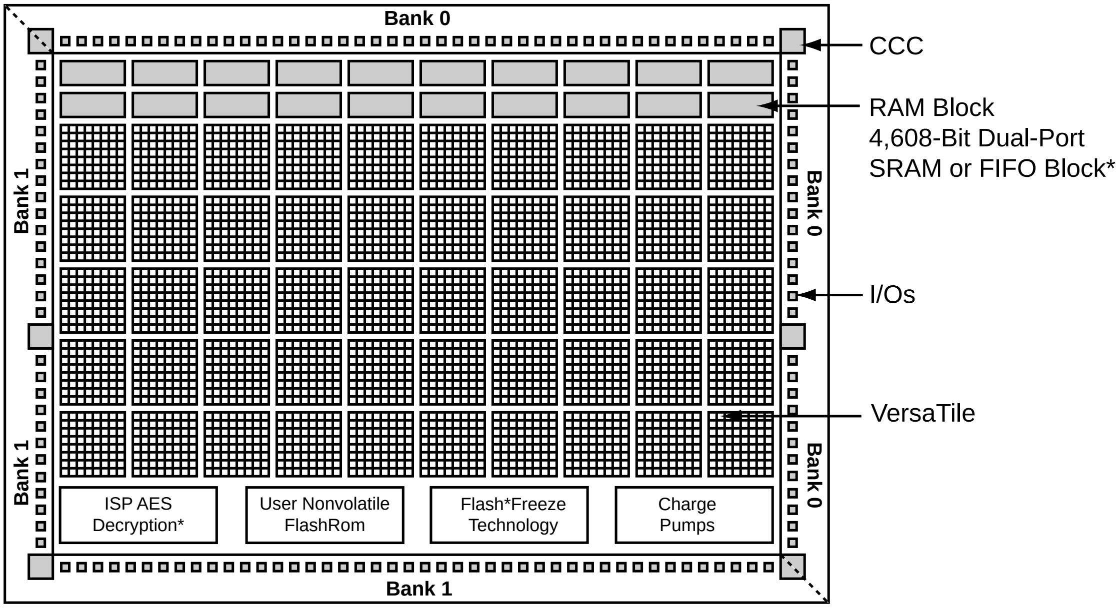
VersaTiles are connected with any of the four levels of routing hierarchy. Flash switches are distributed throughout the device to provide nonvolatile, reconfigurable interconnect programming. Maximum core utilization is possible for virtually any design.



Note: *Not supported by AGL015 and AGL030 devices

Figure 1-1 • **IGLOO Device Architecture Overview with Two I/O Banks (AGL015, AGL030, AGL060, and AGL125)**

Flash*Freeze Technology

The IGLOO device has an ultra-low power static mode, called Flash*Freeze mode, which retains all SRAM and register information and can still quickly return to normal operation. Flash*Freeze technology enables the user to quickly (within 1 µs) enter and exit Flash*Freeze mode by activating the Flash*Freeze pin while all power supplies are kept at their original values. In addition, I/Os and global I/Os can still be driven and can be toggling without impact on power consumption, clocks can still be driven or can be toggling without impact on power consumption, and the device retains all core registers, SRAM information, and states. I/O states are tristated during Flash*Freeze mode or can be set to a certain state using weak pull-up or pull-down I/O attribute configuration. No power is consumed by the I/O banks, clocks, JTAG pins, or PLL, and the device consumes as little as 5 µW in this mode.

Flash*Freeze technology allows the user to switch to active mode on demand, thus simplifying the power management of the device.

The Flash*Freeze pin (active low) can be routed internally to the core to allow the user's logic to decide when it is safe to transition to this mode. It is also possible to use the Flash*Freeze pin as a regular I/O if Flash*Freeze mode usage is not planned, which is advantageous because of the inherent low power static (as low as 12 µW) and dynamic capabilities of the IGLOO device. Refer to Figure 1-3 for an illustration of entering/exiting Flash*Freeze mode.

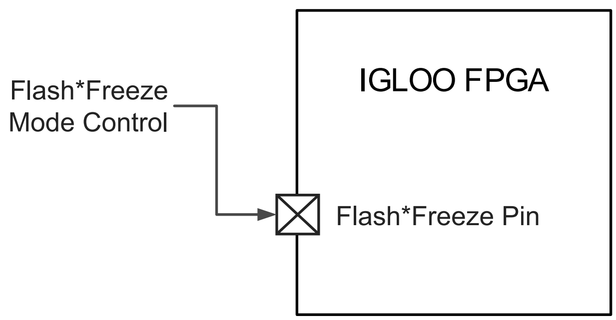

Figure 1-3 • **IGLOO Flash*Freeze Mode**

VersaTiles

The IGLOO core consists of VersaTiles, which have been enhanced beyond the ProASIC<u>PLUS</u>® core tiles. The IGLOO VersaTile supports the following:

- All 3-input logic functions—LUT-3 equivalent
- Latch with clear or set
- D-flip-flop with clear or set
- Enable D-flip-flop with clear or set

Refer to Figure 1-4 for VersaTile configurations.

Revision	Changes	Page
Revision 21 (continued)	Pin description table for AGL125 CS121 was removed as it was incorrectly added to the datasheet in revision 19 (SAR 38217).	-
Revision 20 (March 2012)	Notes indicating that AGL015 is not recommended for new designs have been added. The "Devices Not Recommended For New Designs" section is new (SAR 35015).	I to IV
	Notes indicating that device/package support is TBD for AGL250-QN132 and AGL060-FG144 have been reinserted (SAR 33689).	I to IV
	Values for the power data for PAC1, PAC2, PAC3, PAC4, PAC7, and PAC8 were revised in Table 2-19 • Different Components Contributing to Dynamic Power Consumption in IGLOO Devices and Table 2-21 • Different Components Contributing to Dynamic Power Consumption in IGLOO Devices to match the SmartPower tool in Libero software version 9.0 SP1 and Power Calculator spreadsheet v7a released on 08/10/2010 (SAR 33768).	2-13, 2-15
	The reference to guidelines for global spines and VersaTile rows, given in the "Global Clock Contribution—PCLOCK" section, was corrected to the "Spine Architecture" section of the Global Resources chapter in the *IGLOO FPGA Fabric User Guide* (SAR 34730).	2-17
	Figure 2-4 • Input Buffer Timing Model and Delays (example) has been modified for the DIN waveform; the Rise and Fall time label has been changed to t_{DIN} (SAR 37104).	2-21
	Added missing characteristics for 3.3 V LVCMOS, 3.3 V LVCMOS Wide range, 1.2 V LVCMOS, and 1.2 V LVCMOS Wide range to the following tables: • Table 2-38, Table 2-39, Table 2-40, Table 2-42, Table 2-43, and Table 2-44 (SARs 33854 and 36891) • Table 2-63, Table 2-64, and Table 2-65 (SAR 33854) • Table 2-127, Table 2-128, Table 2-129, Table 2-137, Table 2-138, and Table 2-139 (SAR 36891).	2-35 to 2-40, 2-47 to 2-49, 2-74, 2-77, and 2-77
	AC Loading figures in the "Single-Ended I/O Characteristics" section were updated to match Table 2-50 · AC Waveforms, Measuring Points, and Capacitive Loads (SAR 34878).	2-42
	Added values for minimum pulse width and removed the FRMAX row from Table 2-173 through Table 2-188 in the "Global Tree Timing Characteristics" section. Use the software to determine the FRMAX for the device you are using (SAR 29271).	2-107 through 2-114
Revision 19 (September 2011)	CS121 was added to the product tables in the "IGLOO Low Power Flash FPGAs" section for AGL125 (SAR 22737). CS81 was added for AGL250 (SAR 22737).	I
