### Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

### Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications.

#### Details

|                                |                                                                                                                                             |
|--------------------------------|---------------------------------------------------------------------------------------------------------------------------------------------|

## Flash Advantages

### **Low Power**

Flash-based IGLOO devices exhibit power characteristics similar to those of an ASIC, making them an ideal choice for power-sensitive applications. IGLOO devices have only a very limited power-on current surge and no high-current transition period, both of which occur on many FPGAs.

IGLOO devices also have low dynamic power consumption to further maximize power savings; power is even further reduced by the use of a 1.2 V core voltage.

Low dynamic power consumption, combined with low static power consumption and Flash\*Freeze technology, gives the IGLOO device the lowest total system power offered by any FPGA.

### **Security**

Nonvolatile, flash-based IGLOO devices do not require a boot PROM, so there is no vulnerable external bitstream that can be easily copied. IGLOO devices incorporate FlashLock, which provides a unique combination of reprogrammability and design security without external overhead, advantages that only an FPGA with nonvolatile flash programming can offer.

IGLOO devices utilize a 128-bit flash-based lock and a separate AES key to provide the highest level of protection in the FPGA industry for intellectual property and configuration data. In addition, all FlashROM data in IGLOO devices can be encrypted prior to loading, using the industry-leading AES-128 (FIPS192) bit block cipher encryption standard. AES was adopted by the National Institute of Standards and Technology (NIST) in 2000 and replaces the 1977 DES standard. IGLOO devices have a built-in AES decryption engine and a flash-based AES key that make them the most comprehensive programmable logic device security solution available today. IGLOO devices with AES-based security provide a high level of protection for remote field updates over public networks such as the Internet, and are designed to ensure that valuable IP remains out of the hands of system overbuilders, system cloners, and IP thieves.

Security, built into the FPGA fabric, is an inherent component of the IGLOO family. The flash cells are located beneath seven metal layers, and many device design and layout techniques have been used to make invasive attacks extremely difficult. The IGLOO family, with FlashLock and AES security, is unique in being highly resistant to both invasive and noninvasive attacks. Your valuable IP is protected with industry-standard security, making remote ISP possible. An IGLOO device provides the best available security for programmable logic designs.

### **Single Chip**

Flash-based FPGAs store their configuration information in on-chip flash cells. Once programmed, the configuration data is an inherent part of the FPGA structure, and no external configuration data needs to be loaded at system power-up (unlike SRAM-based FPGAs). Therefore, flash-based IGLOO FPGAs do not require system configuration components such as EEPROMs or microcontrollers to load device configuration data. This reduces bill-of-materials costs and PCB area, and increases security and system reliability.

### **Instant On**

Flash-based IGLOO devices support Level 0 of the Instant On classification standard. This feature helps in system component initialization, execution of critical tasks before the processor wakes up, setup and configuration of memory blocks, clock generation, and bus activity management. The Instant On feature of flash-based IGLOO devices greatly simplifies total system design and reduces total system cost, often eliminating the need for CPLDs and clock generation PLLs. In addition, glitches and brownouts in system power will not corrupt the IGLOO device's flash configuration, and unlike SRAM-based FPGAs, the device will not have to be reloaded when system power is restored. This enables the reduction or complete removal of the configuration PROM, expensive voltage monitor, brownout detection, and clock generator devices from the PCB design. Flash-based IGLOO devices simplify total system design and reduce cost and design risk while increasing system reliability and improving system initialization time.

IGLOO flash FPGAs allow the user to quickly enter and exit Flash\*Freeze mode. This is done almost instantly (within 1  $\mu$ s) and the device retains configuration and data in registers and RAM. Unlike SRAM-based FPGAs the device does not need to reload configuration and design state from external memory components; instead it retains all necessary information to resume operation immediately.

### **Reduced Cost of Ownership**

Advantages to the designer extend beyond low unit cost, performance, and ease of use. Unlike SRAM-based FPGAs, Flash-based IGLOO devices allow all functionality to be Instant On; no external boot PROM is required. On-board security mechanisms prevent access to all the programming information and enable secure remote updates of the FPGA logic. Designers can perform secure remote in-system reprogramming to support future design iterations and

*Note:* For a different output load, drive strength, or slew rate, Microsemi recommends using the Microsemi power spreadsheet calculator or SmartPower tool in Libero SoC.

## Single-Ended I/O Characteristics

### 3.3 V LVTTTL / 3.3 V LVCMOS

Low-Voltage Transistor–Transistor Logic (LVTTTL) is a general-purpose standard (EIA/JESD) for 3.3 V applications. It uses an LVTTTL input buffer and push-pull output buffer. Furthermore, all LVCMOS 3.3 V software macros comply with LVCMOS 3.3 V wide range as specified in the JESD8a specification.

**Table 2-47 • Minimum and Maximum DC Input and Output Levels**

Notes:

1. IIL is the input leakage current per I/O pin over recommended operation conditions where  $-0.3\text{ V} < V_{IN} < V_{IL}$ .
2. IIH is the input leakage current per I/O pin over recommended operating conditions  $V_{IH} < V_{IN} < V_{CCI}$ . Input current is larger when operating outside recommended ranges.
3. Currents are measured at 100°C junction temperature and maximum voltage.
4. Currents are measured at 85°C junction temperature.
5. Software default selection highlighted in gray.

Notes:

1. IIL is the input leakage current per I/O pin over recommended operation conditions where  $-0.3\text{ V} < V_{IN} < V_{IL}$ .
2. IIH is the input leakage current per I/O pin over recommended operating conditions  $V_{IH} < V_{IN} < V_{CCI}$ . Input current is larger when operating outside recommended ranges.
3. Currents are measured at 100°C junction temperature and maximum voltage.
4. Currents are measured at 85°C junction temperature.
5. Software default selection highlighted in gray.

Notes:

- Software default selection highlighted in gray.
- For specific junction temperature and voltage supply levels, refer to Table 2-7 on page 2-7 for derating values.

**Table 2-147 • Minimum and Maximum DC Input and Output Levels**

| DC Parameter        | Description                 | Min.  | Typ.  | Max.  | Units |
|---------------------|-----------------------------|-------|-------|-------|-------|
| VCCI                | Supply Voltage              | 2.375 | 2.5   | 2.625 | V     |
| VOL                 | Output Low Voltage          | 0.9   | 1.075 | 1.25  | V     |
| VOH                 | Output High Voltage         | 1.25  | 1.425 | 1.6   | V     |
| IOL <sup>1</sup>    | Output Lower Current        | 0.65  | 0.91  | 1.16  | mA    |
| IOH <sup>1</sup>    | Output High Current         | 0.65  | 0.91  | 1.16  | mA    |
| VI                  | Input Voltage               | 0     |       | 2.925 | V     |
| IIH <sup>2</sup>    | Input High Leakage Current  |       |       | 10    | μA    |
| IIL <sup>2</sup>    | Input Low Leakage Current   |       |       | 10    | μA    |
| VODIFF              | Differential Output Voltage | 250   | 350   | 450   | mV    |
| VOCM                | Output Common-Mode Voltage  | 1.125 | 1.25  | 1.375 | V     |
| VICM                | Input Common-Mode Voltage   | 0.05  | 1.25  | 2.35  | V     |
| VIDIFF <sup>4</sup> | Input Differential Voltage  | 100   | 350   |       | mV    |

Notes:

1. IOL/IOH is defined by VODIFF/(resistor network)
2. Currents are measured at 85°C junction temperature.

**Table 2-148 • AC Waveforms, Measuring Points, and Capacitive Loads**

| Input Low (V) | Input High (V) | Measuring Point* (V) |
|---------------|----------------|----------------------|
| 1.075         | 1.325          | Cross point          |

Note: \*Measuring point = Vtrip. See Table 2-29 on page 2-28 for a complete table of trip points.

**Timing Characteristics****1.5 V DC Core Voltage****Table 2-149 • LVDS – Applies to 1.5 V DC Core Voltage**

Commercial-Case Conditions: T<sub>J</sub> = 70°C, Worst-Case VCC = 1.425 V, Worst-Case VCCI = 2.3 V  
Applicable to Standard Banks

| Speed Grade | t <sub>DOUT</sub> | t <sub>DP</sub> | t <sub>DIN</sub> | t <sub>py</sub> | Units |
|-------------|-------------------|-----------------|------------------|-----------------|-------|
| Std.        | 0.97              | 1.67            | 0.19             | 1.31            | ns    |

Note: For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 and Table 2-7 on page 2-7 for derating values.

**1.2 V DC Core Voltage****Table 2-150 • LVDS – Applies to 1.5 V DC Core Voltage**

Commercial-Case Conditions: T<sub>J</sub> = 70°C, Worst-Case VCC = 1.14 V, Worst-Case VCCI = 2.3 V  
Applicable to Standard Banks

| Speed Grade | t <sub>DOUT</sub> | t <sub>DP</sub> | t <sub>DIN</sub> | t <sub>py</sub> | Units |
|-------------|-------------------|-----------------|------------------|-----------------|-------|
| Std.        | 1.55              | 2.19            | 0.25             | 1.52            | ns    |

Note: For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 and Table 2-7 on page 2-7 for derating values.

Note: Peak-to-peak jitter measurements are defined by  $T_{\text{peak-to-peak}} = T_{\text{period\_max}} - T_{\text{period\_min}}$ .
