E·XFL **Microsemi Corporation - AGL600V2-FGG484 Datasheet**

Welcome to E-XFL.COM

Understanding Embedded - FPGAs (Field Programmable Gate Array)

Embedded - FPGAs, or Field Programmable Gate Arrays, are advanced integrated circuits that offer unparalleled flexibility and performance for digital systems. Unlike traditional fixed-function logic devices, FPGAs can be programmed and reprogrammed to execute a wide array of logical operations, enabling customized functionality tailored to specific applications. This reprogrammability allows developers to iterate designs quickly and implement complex functions without the need for custom hardware.

Applications of Embedded - FPGAs

The versatility of Embedded - FPGAs makes them indispensable in numerous fields. In telecommunications,

Details	
Product Status	Obsolete
Number of LABs/CLBs	-
Number of Logic Elements/Cells	13824
Total RAM Bits	110592
Number of I/O	235
Number of Gates	600000
Voltage - Supply	1.14V ~ 1.575V
Mounting Type	Surface Mount
Operating Temperature	0°C ~ 70°C (TA)
Package / Case	484-BGA
Supplier Device Package	484-FPBGA (23x23)
Purchase URL	https://www.e-xfl.com/product-detail/microsemi/agl600v2-fgg484

Combinatorial Cells Contribution—$P_{C\text{-}CELL}$

$P_{C\text{-}CELL} = N_{C\text{-}CELL} * \alpha_1 / 2 * P_{AC7} * F_{CLK}$

$N_{C\text{-}CELL}$ is the number of VersaTiles used as combinatorial modules in the design.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in Table 2-23 on page 2-19.

F_{CLK} is the global clock signal frequency.

Routing Net Contribution—P_{NET}

$P_{NET} = (N_{S\text{-}CELL} + N_{C\text{-}CELL}) * \alpha_1 / 2 * P_{AC8} * F_{CLK}$

$N_{S\text{-}CELL}$ is the number of VersaTiles used as sequential modules in the design.

$N_{C\text{-}CELL}$ is the number of VersaTiles used as combinatorial modules in the design.

α_1 is the toggle rate of VersaTile outputs—guidelines are provided in Table 2-23 on page 2-19.

F_{CLK} is the global clock signal frequency.

I/O Input Buffer Contribution—P_{INPUTS}

$P_{INPUTS} = N_{INPUTS} * \alpha_2 / 2 * P_{AC9} * F_{CLK}$

N_{INPUTS} is the number of I/O input buffers used in the design.

α_2 is the I/O buffer toggle rate—guidelines are provided in Table 2-23 on page 2-19.

F_{CLK} is the global clock signal frequency.

I/O Output Buffer Contribution—$P_{OUTPUTS}$

$P_{OUTPUTS} = N_{OUTPUTS} * \alpha_2 / 2 * \beta_1 * P_{AC10} * F_{CLK}$

$N_{OUTPUTS}$ is the number of I/O output buffers used in the design.

α_2 is the I/O buffer toggle rate—guidelines are provided in Table 2-23 on page 2-19.

β_1 is the I/O buffer enable rate—guidelines are provided in Table 2-24 on page 2-19.

F_{CLK} is the global clock signal frequency.

RAM Contribution—P_{MEMORY}

$P_{MEMORY} = P_{AC11} * N_{BLOCKS} * F_{READ\text{-}CLOCK} * \beta_2 + P_{AC12} * N_{BLOCK} * F_{WRITE\text{-}CLOCK} * \beta_3$

N_{BLOCKS} is the number of RAM blocks used in the design.

$F_{READ\text{-}CLOCK}$ is the memory read clock frequency.

β_2 is the RAM enable rate for read operations.

$F_{WRITE\text{-}CLOCK}$ is the memory write clock frequency.

β_3 is the RAM enable rate for write operations—guidelines are provided in Table 2-24 on page 2-19.

PLL Contribution—P_{PLL}

$P_{PLL} = P_{DC4} + P_{AC13} * F_{CLKOUT}$

F_{CLKOUT} is the output clock frequency.†

† *If a PLL is used to generate more than one output clock, include each output clock in the formula by adding its corresponding contribution ($P_{AC13} * F_{CLKOUT}$ product) to the total PLL contribution.*

Single-Ended I/O Characteristics

3.3 V LVTTL / 3.3 V LVCMOS

Low-Voltage Transistor–Transistor Logic (LVTTL) is a general-purpose standard (EIA/JESD) for 3.3 V applications. It uses an LVTTL input buffer and push-pull output buffer. Furthermore, all LVCMOS 3.3 V software macros comply with LVCMOS 3.3 V wide range as specified in the JESD8a specification.

Table 2-47 • **Minimum and Maximum DC Input and Output Levels Applicable to Advanced I/O Banks**

3.3 V LVTTL / 3.3 V LVCMOS	VIL		VIH		VOL	VOH	IOL	IOH	IOSL	IOSH	IIL[1]	IIH[2]
Drive Strength	**Min. V**	**Max. V**	**Min. V**	**Max. V**	**Max. V**	**Min. V**	**mA**	**mA**	**Max. mA[3]**	**Max. mA[3]**	**µA[4]**	**µA[4]**
2 mA	–0.3	0.8	2	3.6	0.4	2.4	2	2	25	27	10	10
4 mA	–0.3	0.8	2	3.6	0.4	2.4	4	4	25	27	10	10

$t_{DDROCKMPWL}$	Clock Minimum Pulse Width Low for the Output DDR	0.28	ns
F_{DDOMAX}	Maximum Frequency for the Output DDR	160.00	MHz

Note: For specific junction temperature and voltage supply levels, refer to Table 2-7 on page 2-7 for derating values.

Table 2-185 • AGL250 Global Resource
Commercial-Case Conditions: T_J = 70°C, VCC = 1.14 V

Parameter	Description	Std. Min.[1]	Std. Max.[2]	Units
t_{RCKL}	Input Low Delay for Global Clock	2.11	2.57	ns
t_{RCKH}	Input High Delay for Global Clock	2.19	2.81	ns
$t_{RCKMPWH}$	Minimum Pulse Width High for Global Clock	1.40		ns
$t_{RCKMPWL}$	Minimum Pulse Width Low for Global Clock	1.65		ns
t_{RCKSW}	Maximum Skew for Global Clock		0.62	ns

Notes:

1. *Value reflects minimum load. The delay is measured from the CCC output to the clock pin of a sequential element, located in a lightly loaded row (single element is connected to the global net).*
2. *Value reflects maximum load. The delay is measured on the clock pin of the farthest sequential element, located in a fully loaded row (all available flip-flops are connected to the global net in the row).*
3. *For specific junction temperature and voltage supply levels, refer to Table 2-6 on page 2-7 for derating values.*

Table 2-186 • AGL400 Global Resource
Commercial-Case Conditions: T_J = 70°C, VCC = 1.14 V

Parameter	Description	Std. Min.[1]	Std. Max.[2]	Units

VJTAG JTAG Supply Voltage

Low power flash devices have a separate bank for the dedicated JTAG pins. The JTAG pins can be run at any voltage from 1.5 V to 3.3 V (nominal). Isolating the JTAG power supply in a separate I/O bank gives greater flexibility in supply selection and simplifies power supply and PCB design. If the JTAG interface is neither used nor planned for use, the VJTAG pin together with the TRST pin could be tied to GND. It should be noted that VCC is required to be powered for JTAG operation; VJTAG alone is insufficient. If a device is in a JTAG chain of interconnected boards, the board containing the device can be powered down, provided both VJTAG and VCC to the part remain powered; otherwise, JTAG signals will not be able to transition the device, even in bypass mode.

Microsemi recommends that VPUMP and VJTAG power supplies be kept separate with independent filtering capacitors rather than supplying them from a common rail.

VPUMP Programming Supply Voltage

IGLOO devices support single-voltage ISP of the configuration flash and FlashROM. For programming, VPUMP should be 3.3 V nominal. During normal device operation, VPUMP can be left floating or can be tied (pulled up) to any voltage between 0 V and the VPUMP maximum. Programming power supply voltage (VPUMP) range is listed in the datasheet.

When the VPUMP pin is tied to ground, it will shut off the charge pump circuitry, resulting in no sources of oscillation from the charge pump circuitry.

For proper programming, 0.01 µF and 0.33 µF capacitors (both rated at 16 V) are to be connected in parallel across VPUMP and GND, and positioned as close to the FPGA pins as possible.

Microsemi recommends that VPUMP and VJTAG power supplies be kept separate with independent filtering capacitors rather than supplying them from a common rail.

User Pins

I/O User Input/Output

The I/O pin functions as an input, output, tristate, or bidirectional buffer. Input and output signal levels are compatible with the I/O standard selected.

During programming, I/Os become tristated and weakly pulled up to VCCI. With VCCI, VMV, and VCC supplies continuously powered up, when the device transitions from programming to operating mode, the I/Os are instantly configured to the desired user configuration.

Unused I/Os are configured as follows:

- Output buffer is disabled (with tristate value of high impedance)
- Input buffer is disabled (with tristate value of high impedance)
- Weak pull-up is programmed

GL Globals

GL I/Os have access to certain clock conditioning circuitry (and the PLL) and/or have direct access to the global network (spines). Additionally, the global I/Os can be used as regular I/Os, since they have identical capabilities. Unused GL pins are configured as inputs with pull-up resistors.

See more detailed descriptions of global I/O connectivity in the "Clock Conditioning Circuits in Low Power Flash Devices and Mixed Signal FPGAs" chapter of the *IGLOO FPGA Fabric User Guide*. All inputs labeled GC/GF are direct inputs into the quadrant clocks. For example, if GAA0 is used for an input, GAA1 and GAA2 are no longer available for input to the quadrant globals. All inputs labeled GC/GF are direct inputs into the chip-level globals, and the rest are connected to the quadrant globals. The inputs to the global network are multiplexed, and only one input can be used as a global input.

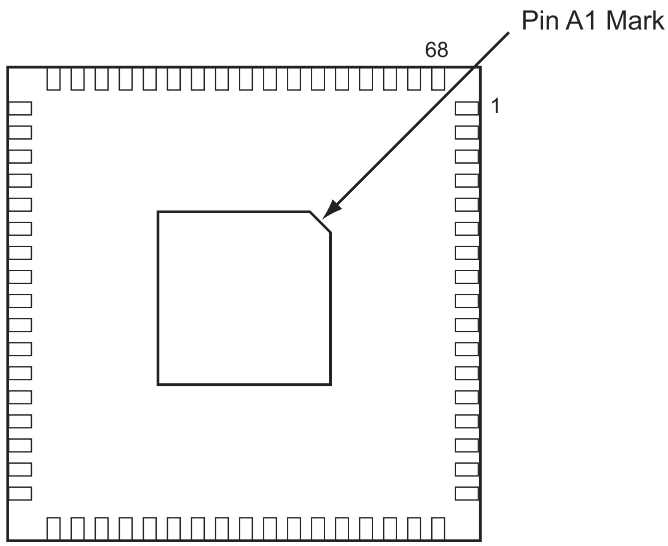
Refer to the "I/O Structures in IGLOO and ProASIC3 Devices" chapter of the *IGLOO FPGA Fabric User Guide* for an explanation of the naming of global pins.

FF Flash*Freeze Mode Activation Pin

Flash*Freeze mode is available on IGLOO devices. The FF pin is a dedicated input pin used to enter and exit Flash*Freeze mode. The FF pin is active low, has the same characteristics as a single-ended I/O, and must meet the maximum rise and fall times. When Flash*Freeze mode is not used in the design, the FF pin is available as a regular I/O.

When Flash*Freeze mode is used, the FF pin must not be left floating to avoid accidentally entering Flash*Freeze mode. While in Flash*Freeze mode, the Flash*Freeze pin should be constantly asserted.

QN68



Notes:

1. *This is the bottom view of the package.*
2. *The die attach paddle center of the package is tied to ground (GND).*

Note

For more information on package drawings, see *PD3068: Package Mechanical Drawings*.

Revision	Changes	Page
Revision 23 (December 2012)	The "IGLOO Ordering Information" section has been updated to mention "Y" as "Blank" mentioning "Device Does Not Include License to Implement IP Based on the Cryptography Research, Inc. (CRI) Patent Portfolio" (SAR 43173).	III
	The note in Table 2-189 · IGLOO CCC/PLL Specification and Table 2-190 · IGLOO CCC/PLL Specification referring the reader to SmartGen was revised to refer instead to the online help associated with the core (SAR 42564). Additionally, note regarding SSOs was added.	2-115, 2-116
	Live at Power-Up (LAPU) has been replaced with 'Instant On'.	NA
Revision 22 (September 2012)	The "Security" section was modified to clarify that Microsemi does not support read-back of programmed data.	1-2
	Libero Integrated Design Environment (IDE) was changed to Libero System-on-Chip (SoC) throughout the document (SAR 40271).	N/A
Revision 21 (May 2012)	Under AGL125, in the Package Pin list, CS121 was incorrectly added to the datasheet in revision 19 and has been removed (SAR 38217).	I to IV
	Corrected the inadvertent error for Max Values for LVPECL VIH and revised the same to '3.6' in Table 2-151 · Minimum and Maximum DC Input and Output Levels (SAR 37685).	2-82
	Figure 2-38 • FIFO Read and Figure 2-39 • FIFO Write have been added (SAR 34841).	2-127
	The following sentence was removed from the VMVx description in the "Pin Descriptions" section: "Within the package, the VMV plane is decoupled from the simultaneous switching noise originating from the output buffer VCCI domain" and replaced with "Within the package, the VMV plane biases the input stage of the I/Os in the I/O banks" (SAR 38317). The datasheet mentions that "VMV pins must be connected to the corresponding VCCI pins" for an ESD enhancement.	3-1
